Forord

I 2012 vil verdens ledere mødes i Rio de Janeiro for at nå til enighed om de globale tiltag, der skal til, for at sikre planetens fremtid og fremtidige generationers ret til at leve et sundt og tilfredsstillende liv, uanset hvor man bor i verden. Dette er det 21. århundredes store udviklingsudfordring.

Human Development Report 2011 er et vigtigt nyt bidrag til den globale dialog omkring denne udfordring. Rapporten viser, hvordan bæredygtighed er uløseligt forbundet med de grundlæggende spørgsmål om social retfærdighed - vi taler om *fairness*, social lighed og bedre adgang til en højere livskvalitet. Bæredygtighed er hverken udelukkende eller hovedsagelig et miljøanliggende, som denne rapport så overbevisende påpeger. Bæredygtighed handler i bund og grund om, hvordan vi vælger at leve vores liv ud fra en forståelse af at alt hvad vi gør, har konsekvenser både for de 7 milliarder mennesker, der lever på jorden i dag, og for de milliarder, som kommer til i de kommende århundreder.

Det er uhyre vigtigt at forstå forbindelsen mellem miljømæssig bæredygtighed og social retfærdighed, hvis vi skal øge menneskers frihed for nulevende og fremtidige generationer. De markante fremskridt i menneskelig udvikling de sidste årtier, som dokumenteret gennem de globale *Human Development Reports*, kan ikke fortsætte, uden at der på verdensplan tages dristige globale skridt i retning af reducere af såvel miljörisici som social ulighed. Denne rapport peger på de måder mennesker, lokalsamfund, lande og det internationale samfund kan fremme miljømæssig bæredygtighed og social retfærdighed, så de bliver gensidig selvforstærkende.

I de 176 lande og områder, hvor FN's udviklingsprogram arbejder hver dag, bærer mange dårligt stillede mennesker en dobbelt byrde af afsavn. De er mere sårbare overfor konsekvenserne af miljøforringelser fordi de har flere alvorlige stressfaktorer i deres liv og samtidig færre værktøjer til at håndtere dem med. De lever også med truslerne mod deres nærmiljø fra indendørs luftforurening, urent vand og dårlig sanitet. Prognoser viser, at hvis vi fortsat undlader at mindske de alvorlige miljörisici og tillader stigende social ulighed, risikerer vi at sænke farten på årtiers vedholdende fremskridt hos verdens fattige flertal – og endda vende den globale konvergens af menneskelig udvikling.

Store misforhold i magtbalancer skaber disse mønstre. Ny analyse viser, hvordan magtbalancer og mangel på ligestilling mellem kønnene på det nationale plan hænger nøje sammen med begrænset adgang til rent vand og forbedret sanitet, jordforringelser og dødsfald forårsaget af indendørs og udendørs luftforurening, som igen forstærker effekterne af en ulige indkomstfordeling. Manglende ligestilling griber også ind i miljømæssige udfald og forværrer dem. På det globale plan er rammerne for mellemstatsligt samarbejde ofte med til at svække udviklingslandenes indflydelse og ekskludere marginaliserede grupper.

Der er dog alternativer til social ulighed og manglende bæredygtighed. Vækst drevet af forbruget af fossilt brændstof er ikke en forudsætning for et bedre liv set ud fra menneskelig udvikling i bred forstand. Investeringer, der fremmer social retfærdighed – eksempelvis adgang til vedvarende energi, vand, sanitet og reproduktiv sundhed vil kunne fremme både bæredygtighed og menneskelig udvikling. Større ansvarlighed og demokratiske processer, til dels gennem støtte til et aktivt civilsamfund og medierne, kan også forbedre resultaterne. Vellykkede tiltag afhænger af, hvordan samfundet styres, herunder institutioner, der er særligt opmærksomme på dårligt stillede grupper og af tværgående tiltag, som koordinerer budgetter og mekanismer på tværs af regeringsorganer og udviklingspartnere.

Efter 2015 har verden brug for en ny udviklingsramme, der rækker længere end 2015 Målene (Millennium Development Goals), og som afspejler social retfærdighed og bæredygtighed. Rio+20 bliver en vigtig lejlighed til at nå frem til en fælles forståelse for, hvordan vi kan komme videre med arbejdet. Denne rapport viser, at tiltag, der integrerer social retfærdighed i politikker og programmer, og som sætter folk i stand til at skabe ændringer på de lovmæssige og politiske arenaer, er meget lovende. Erfaringer fra lande rundt om i verden har vist potentiale for at opnå og fastholde positive synergier gennem disse tiltag.

Den finansiering, der er brug for til udvikling, herunder til finansiering af miljømæssig og social beskyttelse, skal være mange gange større end den nuværende officielle udviklingshjælp. De nuværende udgifter til eksempelvis energikilder med lav CO₂-udledning udgør kun 1,6 procent af selv det laveste skønnede behov, mens udgifterne til klimatilpasning og reduktion af klimaforandringer udgør omkring 11 procent af det skønnede behov. Håbet hviler på en ny klimafinansiering. Her er markedsmekanismer og privat støtte vigtig, men de skal understøttes af proaktive offentlige investeringer. Det kræver innovativ tænkning at dække finansieringsunderskuddet. Denne rapport kommer med nogle bud.

Udover at finde nye finansieringskilder til at tackle de presserende miljømæssige trusler retfærdigt er denne rapport fortaler for reformer, der fremmer social retfærdighed og medbestemmelse. Finansieringsstrømmene skal kanaliseres hen mod løsning af problemerne omkring manglende bæredygtighed og social uretfærdighed – og ikke skærpe eksisterende uligheder.

At skabe muligheder og valg for alle er det centrale mål for menneskelig udvikling. Vi har et fælles globalt ansvar over for de mindst privilegerede blandt os, både i dag og fremover. Og vi har en moralsk forpligtelse til at sikre, at nutiden ikke bliver fremtidens fjende. Denne rapport kan hjælpe os med at finde vejen.

Helen Clark
Administrator
FN's Udviklingsprogram

Analysen og de politiske anbefalinger i denne rapport afspejler ikke nødvendigvis FN's Udviklingsprogram (UNDP) eller dets direktionens synspunkter. Rapporten er en uafhængig publikation rekvireret af UNDP. Research til og udarbejdelse af rapporten blev udført i samarbejde mellem Human Development Report-teamet og en gruppe fremragende rådgivere ledet af Jeni Klugman, direktør for Human Development Report Office.

Sammendrag

Dette års rapport fokuserer på udfordringen for en bæredygtig og social retfærdig udvikling. Ud fra en fælles betragtning ses det tydeligt, at forringelser af miljøet forværre uligheder ved at ramme de mennesker, der i forvejen er dårligt stillede hårdest. På samme tid forværres uligheder i menneskelig udvikling nedbrydningen af miljøet.

Menneskelig udvikling, som handler om at øge menneskers valgmuligheder, bygger på fælles naturressourcer. For at fremme menneskelig udvikling kræves det, at der sættes fokus på bæredygtighed – lokalt, nationalt og globalt – og det både kan og skal gøres på en socialt retfærdig måde, som styrker menneskers indflydelse på deres eget liv.

Vi vil sikre, at der på vejen mod styrket miljømæssig bæredygtighed tages hensyn til fattige menneskers bestræbelser på at få et bedre liv. Og vi peger på måder, hvorpå mennesker, samfund, lande og det internationale samfund kan fremme bæredygtighed og social retfærdighed, således at disse bliver gensidigt selvforstærkende.

Hvorfor bæredygtighed og social retfærdighed?

Begrebet menneskelig udvikling er vedvarende relevant for den måde, vi ser på verden og de nuværende og fremtidige udfordringer, vi står over for. *Human Development Report (HDR)* havde sidste år 20-års jubilæum. I den forbindelse fejrede rapporten begrebet menneskelig udvikling ved at fremhæve, hvordan social retfærdighed, *empowerment* og bæredygtighed øger menneskers valgmuligheder. Rapporten fremhævede samtidig de iboende udfordringer, der ligger i, at disse hovedaspekter af menneskelig udvikling ikke altid følges ad.

Argumenter for at se på bæredygtighed og social retfærdighed i sammenhæng

I år udforsker vi skæringspunktet mellem miljømæssig bæredygtighed og social retfærdighed, som grundlæggende ligner hinanden i deres fokus på fordelingsmæssig retfærdighed. Vi tillægger bæredygtighed stor betydning, fordi fremtidige generationer som minimum bør have de samme muligheder, som vi har i dag. Ligeledes er alle socialt ulige processer uretfærdige: Folks mulighed for at få et bedre liv bør ikke begrænses af faktorer, som de ikke selv er herre over. Ulighed er særlig uretfærdig, når bestemte grupper enten på grund af køn, race eller fødested systematisk stilles dårligere end andre.

For mere end 10 år siden argumenterede Sudhir Anand og Amartya Sen for at se på bæredygtighed og social retfærdighed i sammenhæng. "Det ville være en grov overtrædelse af det universelle princip," argumenterede de, "hvis vi udelukkende fokuserede på social retfærdighed *mellem* generationer uden samtidig at forholde os til problemet med social retfærdighed *inden for* generationer". Brundtland-Kommissionens rapport fra 1987 indeholdt lignende synspunkter, og det gjorde en række internationale deklARATIONER fra Stockholm i 1972 til Johannesburg i 2002 også. På trods af dette negligeres spørgsmålet om lighed stadig i mange debatter om bæredygtighed og behandles som et separat spørgsmål uden sammenhæng. Denne tilgang er utilstrækkelig og kan i sidste ende give bagslag.

Definitioner af nøglebegreber

Menneskelig udvikling er udvidelse af menneskers frihed og evner til at leve et liv, som de værdsætter og har grund til at værdsætte. Det handler om udvidede valgmuligheder.

Bæredygtig menneskelig udvikling handler om at øge de væsentlige friheder, folk har i dag og samtidig gøre en fornuftig indsats for at undgå at bringe fremtidige generationers frihed i fare

Frihed og evner er mere omfattende begreber end basale behov. Mange faktorer er nødvendige for et "godt liv"; faktorer, der kan have en iboende værdi såvel som en instrumentel værdi – vi kan for eksempel værdsætte biodiversitet eller naturlig skønhed uafhængig af deres bidrag til vores levestandard.

Mennesker, som er dårligt stillede, er et centralt fokus for menneskelig udvikling. Det indbefatter de mennesker, som i fremtiden vil lide under de mest alvorlige konsekvenser af de risici, der opstår som følge af vores handlinger i dag. Vi beskæftiger os ikke blot med de gennemsnitlige og mest sandsynlige scenarier, men også med de mindre sandsynlige, men dog stadig mulige scenarier, hvor situationen for fattige og udsatte grupper kan gå hen og blive katastrofal.

Debatter omkring betydningen af miljømæssig bæredygtighed fokuserer ofte på, hvorvidt menneskeskabt kapital kan erstatte naturressourcer – hvorvidt menneskelig opfindsomhed kan mindske konsekvenserne af begrænsede naturressourcer, sådan som det tidligere er sket. Det er uvist, hvorvidt det vil være muligt i fremtiden, og set i lyset af risikoen for en katastrofe er det klart at foretrække, at vi bevarer basale naturressourcer og økoprocesser, som knytter sig dertil. Dette synspunkt er også på linje med

en menneskerettighedsbaseret tilgang til udvikling. *Bæredygtig menneskelig udvikling handler om at øge de væsentlige friheder, folk har i dag og samtidig gøre en fornuftig indsats for at undgå at bringe fremtidige generationers frihed i fare.* En saglig og informeret offentlig debat har afgørende betydning for denne idé og er nødvendig for at definere hvilke risici, et samfund er villig til at acceptere (figur 1).

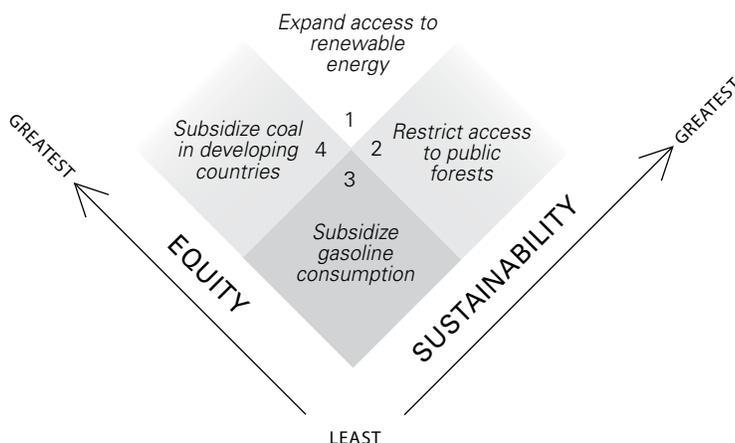

Den samlede stræben efter miljømæssig bæredygtighed og social retfærdighed kræver ikke, at de to altid er gensidig selvforstærkende. I mange tilfælde vil det være en afvejning. Tiltag som har til formål at forbedre miljøet kan påvirke den sociale retfærdighed negativt – f.eks. hvis de begrænser den økonomiske vækst i udviklingslandene. Denne rapport illustrerer de former for samlede påvirkninger, som forskellige politikker kan have, men anerkender samtidig, at disse ikke er universelt gældende, og at konteksten altid har afgørende betydning.

Rammen tilskynder særlig opmærksomhed på identificering af de positive synergier og hensyntagen til de nødvendige afvejninger, der vil skulle foretages. Vi undersøger, hvordan samfund kan implementere løsninger, der både er til gavn for bæredygtighed, social retfærdighed og menneskelig udvikling.

FIGUR 1

En illustration af synergier og afvejninger mellem retfærdighed og bæredygtighed

Denne ramme tilskynder særlig fokus på identificering af de positive synergier mellem de to mål og afvejningen af disse.

Mønstre og tendenser, udvikling og muligheder

Der er stigende bevis for en omfattende miljøtilbagegang over hele verden og en potentiel forværring i fremtiden. Da omfanget af de fremtidige forandringer er usikre, opstiller vi i rapporten en række mulige scenarier og undersøger deres betydning for menneskelig udvikling. Vores udgangspunkt og hovedtemaet i HDR 2010 er den enorme fremgang, der er sket i den menneskelige udvikling over de seneste årtier – med tre advarsler:

- Stigningen i indkomster har været forbundet med tilbagegang inden for vigtige miljøindikatorer såsom CO2-udledning, jord- og vandkvalitet samt størrelsen af skovarealer.

- Indkomstfordelingen er blevet forværret på landeniveau i store dele af verden, selvom forskellene inden for sundhed og uddannelse er blevet mindre.
- Der er en gennemsnitlig tendens til at *empowerment* går hånd i hånd med et stigende *Human Development Index* (HDI), men tendensen bærer præg af betydelig variation.

Ifølge simulationer udarbejdet til denne rapport vil HDI i år 2050 være 8 procent lavere end udgangspunktet, og det er i scenariet "miljøudfordring", der tager højde for den globale opvarmnings negative effekter på landbrugsproduktion, adgang til rent vand og forbedret sanitet og på forurening (og 12 procent lavere i Sydasiens og Afrika Syds Sahara). I det mere kritiske scenarie "miljøkatastrofe", som forudser omfattende skovfældning og jordforringelser, dramatisk fald i biodiversitet og mere ekstreme vejrforhold, vil det globale HDI være cirka 15 procent lavere end udgangspunktet.

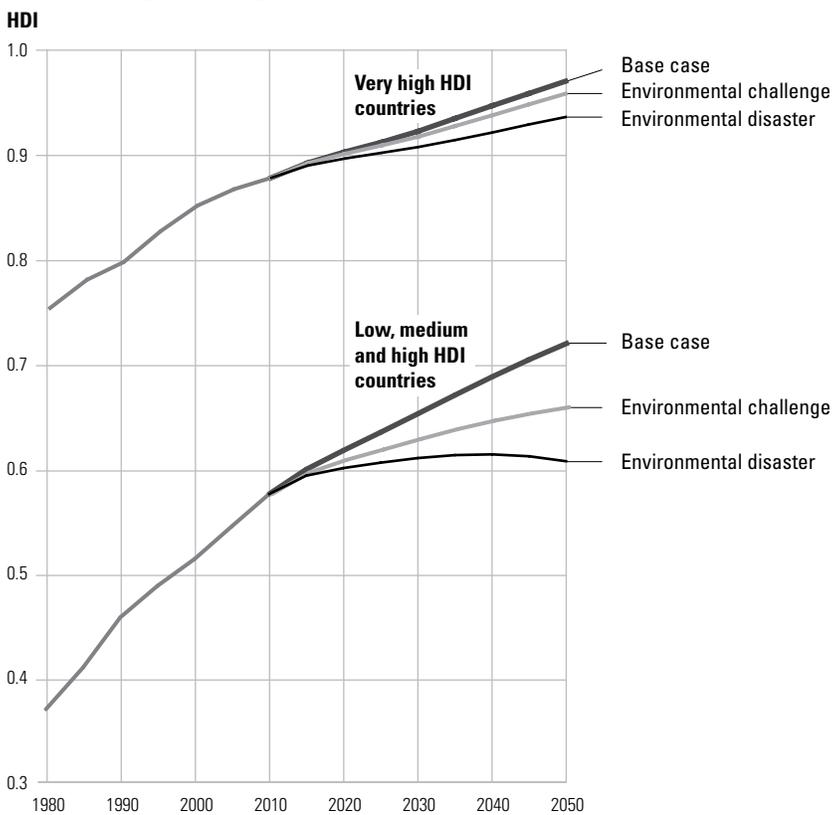

Figur 2 illustrerer omfanget af det tab og de risici, vores børnebørn står over for, hvis vi ikke gør noget for at stoppe og begrænse de nuværende tendenser. Miljøkatastrofe-scenariet vil føre til et vendepunkt i udviklingslandene før år 2050, så deres HDI ikke længere vil konvergere mod de rige landes HDI.

Ifølge denne prognose er det i mange tilfælde de dårligst stillede, der fortsat vil bære konsekvenserne af miljøforringelserne, på trods af de kun i meget begrænset omfang har bidraget til problemerne. Eksempelvis har lande med den laveste HDI bidraget mindst til de globale klimaforandringer, men samtidig er det disse lande, som har oplevet det største fald og de største variationer i regnmængde (figur 3), hvilket har konsekvenser for deres landbrugsproduktion og livsgrundlag.

Udledning pr. indbygger er langt højere i lande med meget højt HDI end i lande med lavt, middel og højt HDI til sammen på grund af mere energi-intensive aktiviteter – bilkørsel, opvarmning og nedkøling af boliger og forretninger og forbrug af forarbejdede og emballerede fødevarer. En gennemsnitsperson, der bor i et land med et meget højt HDI, udleder mere end fire gange så meget CO₂ og omkring dobbelt så meget metan og dinitrogenoxid som en

FIGUR 2

Scenarier, der viser de konsekvenser, som miljørisici vil have for menneskelig udvikling frem til 2050

Note: See text for explanation of scenarios.

Source: HDRO calculations based on data from the HDRO database and B. Hughes, M. Irfan, J. Moyer, D. Rothman, and J. Solórzano, 2011, "Forecasting the Impacts of Environmental Constraints on Human Development," Human Development Research Paper, United Nations Development Programme, New York, who draw on forecasts from International Futures, Version 6.42.

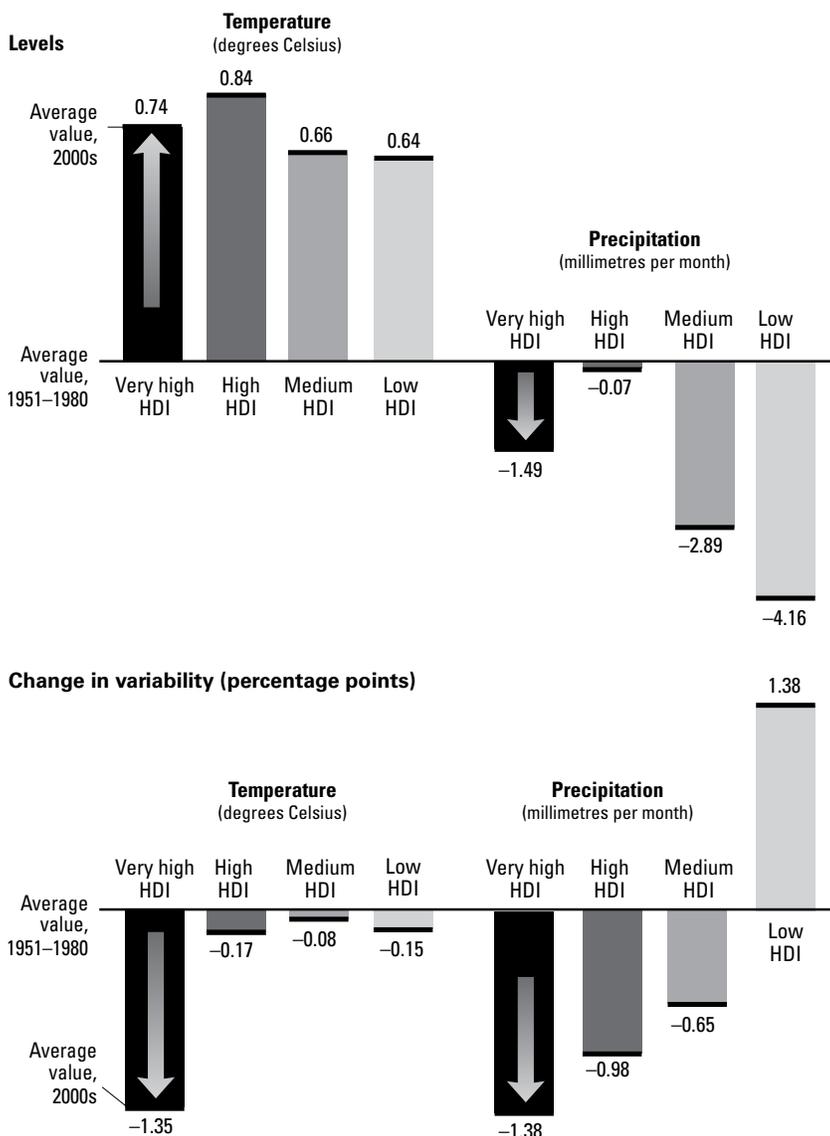

person, der bor i et land med et lavt, middel eller højt HDI – og ca. 30 gange mere CO₂ end en person, der bor i et land med et lavt HDI. En gennemsnitsperson i Storbritannien udleder på to måneder den samme mængde drivhusgas som en person, der bor i et land med et lavt HDI, forbruger på et år. Og en gennemsnitsperson i Qatar – som er det land, der har den største udledning pr. indbygger – forbruger den samme mængde på kun 10 dage, selvom mængden her afspejler såvel forbrug som produktion af varer, der forbruges andre steder i verden.

Mens tre fjerdedele af væksten i udledninger siden 1970 kommer fra lande med lavt, middel og højt HDI, forbliver det samlede niveau af drivhusgasser meget højere i lande med meget højt HDI. Og dette gælder også uden, at der tages hensyn til flytningen af kulstofintensiv produktion til fattigere lande, hvis produktion i vid udstrækning eksporteres til rige lande.

FIGUR 3

Stigende temperaturer og faldende regnmængder

Levels and changes in climate variability by HDI group

Note: Change in variability is the difference in the coefficients of variation between 1951–1980 and the 2000s, weighted by average population for 1951–1980.

Source: HDRO calculations based on data from the University of Delaware.

Verden rundt har stigende HDI været ledsaget af miljøforringelser – selvom størstedelen af skaden kan føres tilbage til økonomisk vækst. Sammenlign det første og tredje kvadrant i figur 4. Lande med høje indtægter har generelt højere CO₂-udledning pr. indbygger. Men der er ingen forbindelse mellem niveauet af CO₂-udledninger og sundheds- og uddannelseskomponenterne i HDI. Dette resultat er intuitivt: Aktiviteter, der udleder CO₂ i atmosfæren, er dem, der er forbundet med produktion af varer og

ikke med levering af sundheds- og uddannelsesydelser. Resultater viser også den uli-nære forbindelse mellem CO₂-udledning pr. indbygger og HDI-komponenter: Lille eller ingen forbindelse ved lavt HDI, men med en stigning i HDI nås på et tidspunkt et ‘vendepunkt’, hvor der ses en stærk positiv sammenhæng mellem CO₂-udledning og indtægt.

Lande med hurtige forbedringer i HDI har også oplevet kraftige stigninger i CO₂-udledning pr. indbygger. Snarere end et øjebliksbillede af sammenhængen fremhæver disse ændringer over tid, hvad morgendagen bringer som resultat af udviklingen i dag. Endnu engang driver indkomståndringer tendensen.

Men disse sammenhænge gælder ikke for alle miljøindikatorer. Vores analyse påviser kun en svag positiv sammenhæng mellem eksempelvis HDI og skovfældning. Hvorfor adskiller CO₂-udledninger sig fra andre miljøtrusler? Vi mener, at hvor der er en direkte forbindelse mellem miljø og livskvalitet, som ved forurening, er de miljømæssige resultater større i udviklede lande; hvor forbindelsen er mere diffus, er resultatet meget svagere. Når vi ser på sammenhængen mellem miljørisici og HDI, når vi frem til tre generelle resultater:

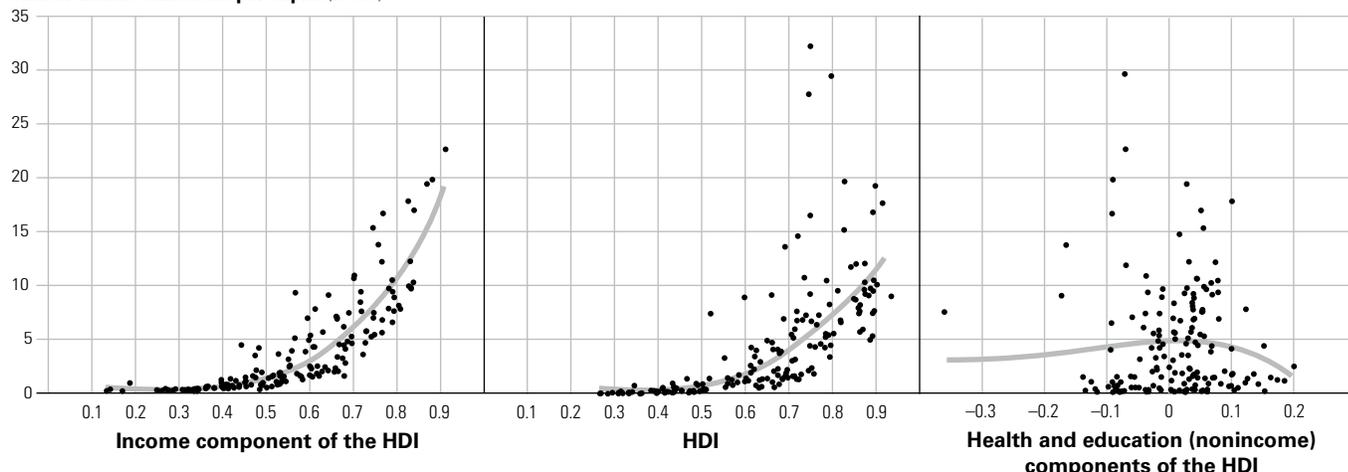

- Miljømæssige afsavn i husstanden – inden-dørs luftforurening, utilstrækkelig adgang til rent vand og forbedret sanitet – er værre i lande med lavt HDI og bliver mindre, efterhånden som HDI stiger.
- Miljörisici, som påvirker samfundet, såsom luftforurening i byerne, synes først at stige og derefter falde i takt med udviklingen; nogle mener, at en omvendt U-formet kurve beskriver denne sammenhæng.
- Miljörisici med global effekt – dvs. drivhusgasudledninger – stiger typisk i takt med HDI.

HDI er ikke i sig selv den egentlige drivkraft bag disse forandringer. Indtægter og økonomisk vækst spiller en vigtig rolle i forklaringen, men sammenhængen er ikke fuldkommen endegyldig. Risikomønstrene påvirkes af det komplekse samspil mellem bredere kræfter: For eksempel tillader international handel,

FIGUR 4

CO2 har en stærk og positiv indflydelse på indtægt, en svag på HDI og ingen på sundhed og uddannelse

Carbon dioxide emissions per capita (tonnes)

Note: Data are for 2007.

Source: HDRO calculations, based on data from the HDRO database.

at lande kan outsource produktion af varer, der skader miljøet. Omfattende udnyttelse af naturressourcer til kommercielle formål belaster anderledes end udnyttelse af naturressourcer til selvforsyning, og den miljømæssige profil for land og by er meget forskellig. Endelig betyder politikker og den politiske kontekst rigtig meget.

Det skal hertil understreges, at mønstrene ikke er givet. Mange lande har opnået store fremskridt med hensyn til både HDI, social retfærdighed og miljømæssig bæredygtighed. I tråd med vores fokus på positive synergier foreslår vi en flerdimensionel strategi til at identificere de lande, der har været bedre end andre i samme region til at fremme social retfærdighed, hæve HDI, reducere husstandes indendørs luftforurening og øge adgang til rent vand, og som er de bedste både regionalt og

globalt inden for miljømæssig bæredygtighed (tabel 1). Miljømæssig bæredygtighed vurderes ud fra drivhusgasudledning, vandforbrug og skovrydning. På grund af ufuldkommen data og andre forhold, som gør sammenligning vanskelig, er resultaterne illustrative snarere end de giver et fuldkomment billede. Kun ét land, nemlig Costa Rica, ligger over den regionale median på alle kriterier, mens de tre andre, som ligger i top, scorer uensartet på de forskellige indikatorer. Sverige er bemærkelsesværdig og skiller sig ud fra det regionale og globale gennemsnit på grund af landets indsats omkring genplantning af skovområder.

Vores liste viser, at lande på tværs af regioner, udviklingstrin og strukturelle karakteristika kan vedtage politikker, der bidrager til miljømæssig bæredygtighed, social retfærdighed og de vigtigste dimensioner i HDI. Dette

TABEL 1

Lande der klarer sig godt mht. miljø, retfærdighed og menneskelig udvikling, senest tilgængelige år

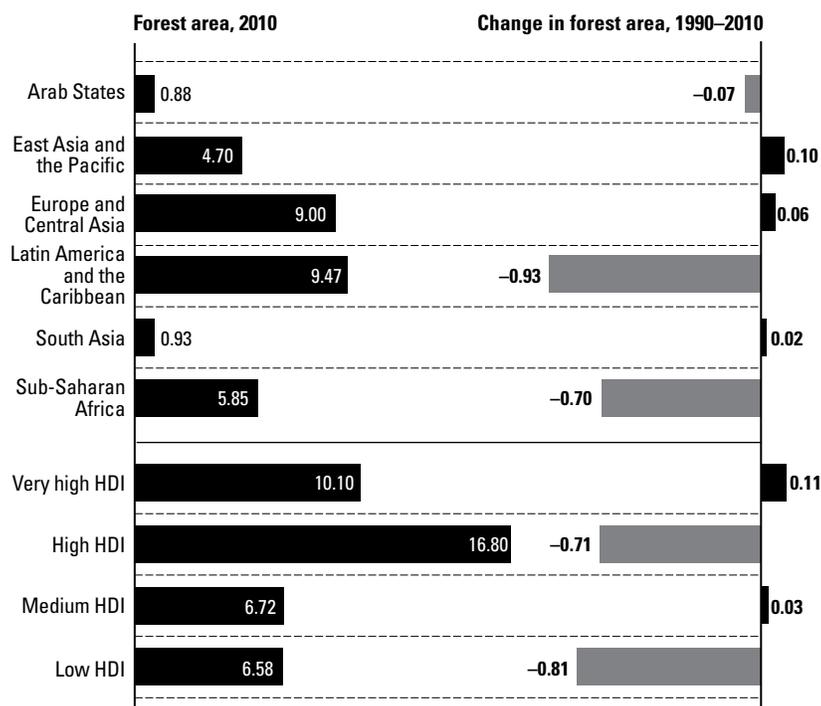

Country	Global threats			Local impacts		Equity and human development	
	Greenhouse gas emissions	Deforestation	Water use	Water access	Air pollution	HDI (percent of regional median)	Overall loss (percent of regional median)
Costa Rica	✓	✓	✓	✓	✓	104	77
Germany		✓	✓	✓	✓	103	91
Philippines	✓	✓		✓	✓	103	89
Sweden		✓	✓	✓	✓	102	70

Note: These countries all pass the criteria of absolute thresholds for global threats as defined in the full Report (chapter 2, note 80), perform better than the median of their respective regional peers both in the human development and inequality dimensions and perform better than the regional median for local impacts.

FIGUR 5

Nogle regioner ryddes for skov, andre genplantes og tilplantes med skov

Forest cover shares and rates of change by region, 1990–2010 (millions of square kilometres)

Source: HDRO calculations based on data from World Bank, 2011, *World Development Indicators*, Washington, DC: World Bank.

års rapport gennemgår de politikker og programmer, der har ført til succes og understreger samtidig betydningen af lokale forhold og kontekst.

Mere generelt viser de miljømæssige tendenser over de seneste årtier en tilbagegang på flere fronter med negative konsekvenser for menneskelig udvikling og ikke mindst for de millioner af mennesker, der er direkte afhængige af naturressourcer for deres livsgrundlag.

- Globalt set er næsten 40 procent jord blevet forringet på grund af jorderosion, nedsat frugtbarhed og overdreven græsning. Jordproduktiviteten er faldende med et skønnet udbyttetab på helt op til 50 procent i de mest negative scenarier.
- Landbrug tegner sig for 70-85 procent af vandforbruget, og det skønnes, at der i 20 procent af verdens samlede kornproduktion ikke bruges vand på en bæredygtig måde, hvilket bringer fremtidig landbrugs-vækst i fare.

- Skovrydning er en stor udfordring. Mellem 1990 og 2010 oplevede Latinamerika, Caribien samt Afrika Syd for Sahara de største tab af skovområder, efterfulgt af de arabiske stater (figur 5). I de resterende regioner har der været en mindre tilvækst af skovområder.

- Ørkendannelse truer de tørre områder, der er hjemsted for omkring en tredjedel af verdens befolkning. Nogle områder er specielt sårbare – især Afrika Syd for Sahara, hvor de tørre områder er yderst følsomme, og tilpasningsevnen er lav.

Negative miljøfaktorer forventes at få verdens fødevarepriser til at stige med 30-50 procent i faste priser i de kommende årtier, og der vil blive større prisustabilitet med negative konsekvenser for fattige husstande. De 1,3 milliarder mennesker, der er afhængige af landbrug, fiskeri, skovbrug og jagt står over for de største risici. Byrden af miljøforringelser og klimaforandringer vil sandsynligvis skabe uligheder på tværs af grupperne af forskellige grunde:

- I landområder er mange fattiges indtægt dybt afhængig af naturressourcer. Selv folk, som ikke normalt er afhængige af naturressourcer, bliver det måske som en overlevelsesstrategi i hårde tider.
- Hvordan miljøforringelser vil påvirke folk afhænger af, om de er nettoproducenter eller nettoforbrugere af naturressourcer, om de producerer til selvforsyning eller til markedet, og hvor let de kan skifte mellem disse aktiviteter og sprede deres indtjening ud på andre typer beskæftigelse.
- I dag lever omkring 350 millioner mennesker, mange af dem fattige, i eller nær skove, som de er afhængige af for at kunne forsyne sig selv og have en indtægt. Men både skovrydning og begrænsninger i adgangen til naturressourcer kan skade de fattige. Erfaringerne fra en række lande peger på, at kvinder typisk er mere afhængige af skove end mænd, fordi kvinder ofte har færre beskæftigelsesmuligheder, er mindre mobile og har størstedelen af ansvaret for at samle brænde.

- Omkring 45 millioner mennesker – heraf mindst 6 millioner kvinder – lever af fiskeri og er truet af overfiskeri og klimaforandringer. Sårbarheden er dobbelt: De lande, der er mest truede, er også mest afhængige af fisk som kostprotein, livsgrundlag og eksport. Klimaforandringer forventes at føre til store fald i fiskebestandene ved Stillehavsoerne, mens der forudsiges forbedringer på nogle nordlige breddegrader, herunder ved Alaska, Grønland, Norge og Rusland.

I det omfang at kvinder i fattige lande, i uforholdsmæssig grad, er involveret i dyrkning af afgrøder til eget forbrug og vandhentning, er de negative konsekvenser af miljøforringelser større for dem. Mange oprindelige folk er også meget afhængige af naturressourcer og lever i økosystemer, der er specielt sårbare over for effekterne af klimaforandringer, som for eksempel i små udviklingsøstater, arktiske regioner og højtliggende områder. Undersøgelser viser, at traditionel praksis kan beskytte naturressourcer, men denne viden overses eller bagatelliseres ofte.

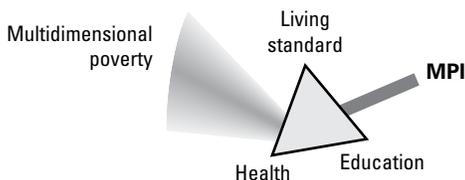

Effekten af klimaforandringer på landmænds livsgrundlag afhænger af afgrøde, geografisk placering og sæson, og det understreger vigtigheden af dybdegående lokale analyser. Påvirkningerne vil også være forskellige alt efter husholdningernes produktions- og forbrugsmønstre, adgang til ressourcer, fattigdomsniveau og tilpasningsevne. Samlet set vil den biofysiske nettopåvirkning af klimaforandringer på kunstvandede og regnafhængige afgrøder sandsynligvis være negativ i 2050 – og det vil gå hårdest ud over lande med lavt HDI.

Forståelse af sammenhængene

Med udgangspunkt i de vigtige skæringspunkter mellem miljø og social retfærdighed på globalt plan undersøger vi sammenhængene på samfunds- og husstands niveau. Vi fremhæver også lande og grupper, der har brudt mønstret, og understreger forandringerne i kønsroller og menneskers indflydelse på eget liv. Et hovedtema er, at de mennesker, som er dårligst stillede, bærer en dobbelt byrde af afsavn. De

FIGUR 6

Flerdimensionelt fattigdomsindeks (MPI) – et fokus på de mest underprivilegerede

er både mere sårbare over for de overordnede effekter af miljøforringelser og skal tilmed leve med de trusler mod deres nærmiljø, som indendørs luftforurening, beskidt vand og dårlig sanitet udgør. Vores flerdimensionelle fattigdomsindeks (*Multidimensional Poverty Index* – MPI), som blev introduceret i HDR 2010, er i år gjort op for 109 lande og ser nærmere på disse afsavn og viser, hvor de er mest kritiske.

MPI måler alvorlige mangler inden for sundhed, uddannelse og levestandard ved at se både på antallet af underprivilegerede og intensiteten af deres afsavn (figur 6). I år ser vi nærmere på, hvor gennemgribende de miljørelaterede afsavn er blandt de flerdimensionelt fattige, og hvordan de overlapper på husstands niveau. Dette er en fornyelse i MPI'et.

Med fokus på fattigdom kan vi undersøge miljømæssige afsavn i form af adgang til moderne brændsel til madlavning, rent vand og basale toiletforhold. Disse absolutte afsavn,

TABEL 2

De 10 lande med den laveste andel af miljømæssige afsavn blandt de flerdimensionelt fattige, senest tilgængelige data i perioden 2000-2010

Lowest share of multidimensionally poor with at least one deprivation	Lowest share of multidimensionally poor with all three deprivations
Brazil	Bangladesh
Guyana	Pakistan
Djibouti	Gambia
Yemen	Nepal
Iraq	India
Morocco	Bhutan
Pakistan	Djibouti
Senegal	Brazil
Colombia	Morocco
Angola	Guyana

Note: Countries in bold are on both lists.

uddannelse og andre
dimensioner af velfærd**

der er vigtige i sig selv, udgør store brud på menneskerettighederne. Ved at gøre en ende på disse afsavn øges folks valgmuligheder og derved menneskelig udvikling.

I udviklingslandene lider mindst 6 ud af 10 personer af et af disse miljørelaterede afsavn og 4 ud af 10 af to eller flere. Disse afsavn er særlig akutte blandt flerdimensionelt fattige mennesker, hvor mere end 9 ud af 10 lider under mindst ét. De fleste lider under flere afsavn: 8 ud af 10 flerdimensionelt fattige mennesker lider under to eller flere, og næsten 1 ud af 3 (29 procent) lider afsavn på alle tre områder. Disse miljørelaterede afsavn bidrager uforholdsmæssigt meget til flerdimensionel fattigdom, idet de udgør 20 procent af MPI – ud over deres 17 procent vægtning i indekset. Generelt er det største afsavn i de fleste udviklingslande adgang til madlavningsbrændsel, mens det altafgørende problem i mange arabiske lande er mangel på vand.

For bedre at forstå de miljørelaterede afsavn analyserede vi mønstrene for givne fattigdomsniveauer. Lande blev rangeret på baggrund af andelen af flerdimensionelt fattige personer, der led under et miljørelateret afsavn og den andel, der led under alle tre. Andel af befolkningen med miljørelaterede afsavn

stiger med MPI, men tendensen varierer betydeligt. Lande med den laveste andel af fattige, der lider under mindst ét afsavn, findes primært blandt de arabiske, latinamerikanske og caribiske stater (7 ud af de øverste 10).

Af de lande, som har færrest flerdimensionelt fattige, som lider under alle tre miljørelaterede afsavn, klarer stater i Sydasiens sig bedst – med 5 ud af de øverste 10 (se tabel 2, højre kolonne). Mange sydasiatiske lande har reduceret nogle af de miljørelaterede afsavn, særligt adgang til drikkevand, samtidig med at andre afsavn er forblevet alvorlige. Og fem lande er blandt de øverste 10 på begge lister – ikke alene er deres miljømæssige fattigdom relativt lav, den er også mindre intens.

Der er ikke nødvendigvis en sammenhæng mellem landenes præstation på disse indikatorer og miljørisici i bred forstand, som f.eks. risikoen for oversvømmelse. Samtidig er de fattige, der oftest er udsat for direkte miljømæssige trusler, også mere udsatte for miljøforringelser af større målestok.

Vi undersøger dette mønster yderligere ved at se på sammenhængen mellem MPI og de belastninger, klimaforandringer forårsager. For 130 nationalt definerede administrative regioner i 15 lande sammenligner vi område-specifikke MPI'er med ændringer i nedbør og temperatur. Generelt ser de fattigste regioner og lokaliteter i disse lande ud til at være blevet varmere, men ikke meget vådere eller tørrere – en ændring, der stemmer overens med resultater af undersøgelser af klimaforandrings virkninger på indkomstfattigdom.

Miljømæssige trusler mod udvalgte dimensioner af menneskelig udvikling

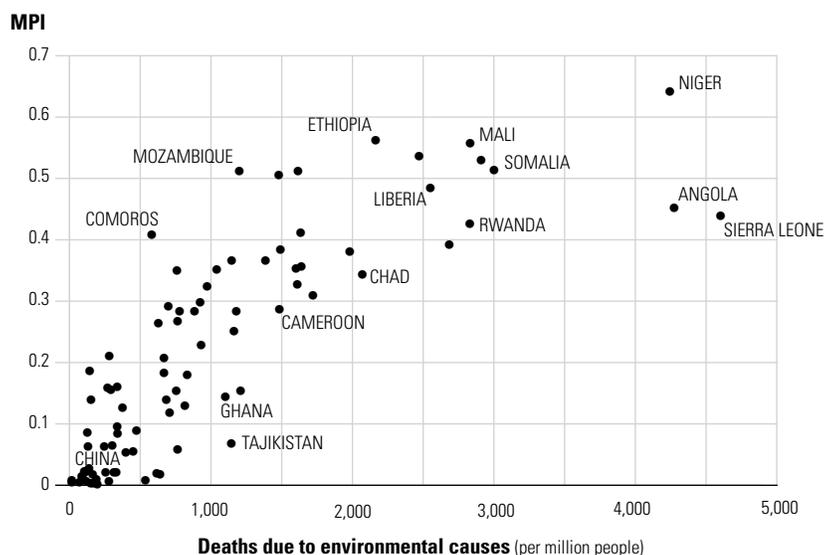

Miljøforringelser begrænser folks evner på mange måder ved ikke blot at ramme indkomst og levebrød, men ved også at indvirke på helbred, uddannelse og andre dimensioner af velfærd.

Dårligt miljø og helbred

– overlappende afsavn

Den sygdomsbyrde, som følger af inden- og udendørs luftforurening, snavset vand og dårligt sanitet, er størst for folk i fattige lande, specielt

FIGUR 7
Antallet af dødsfald, der skyldes miljørisici, er højere i lande med et højt MPI-niveau.

Note: Excludes very high HDI countries. Survey years vary by country; see statistical table 5 in the full Report for details.
Source: A. Prüss-Ustün, R. Bos, F. Gore, and J. Bartram, 2008, *Safer Water, Better Health: Costs, Benefits and Sustainability of Interventions to Protect and Promote Health*, Geneva: World Health Organization.

dårligt stillede grupper. Indendørs luftforurening dræber 11 gange flere mennesker i lande med et lavt HDI, end det gør andre steder. Dårligt stillede grupper i lande med et lavt, middel eller højt HDI har en større risiko for udendørs forurening på grund af såvel højere eksponering som større sårbarhed. I lande med et lavt HDI mangler mere end 6 ud af 10 personer adgang til rent vand, mens 4 ud af 10 mangler adgang til rene toiletforhold, hvilket bidrager til både sygdom og fejlnæring. Klimaforandringer truer med at forværre disse uligheder gennem spredningen af tropiske sygdomme såsom malaria og denguefeber og gennem faldende høstudbytte.

WHO's database over den globale sygdomsbyrde indeholder slående data om miljøfaktorerens følgevirkninger, herunder at urent vand og utilstrækkelig sanitet og hygiejne er blandt de 10 største sygdomsårsager på verdensplan. Hvert år dræber miljørelaterede sygdomme, herunder akutte infektioner i åndedrætssystemet og diarré, mindst 3 millioner børn under 5 år – det svarer til mere end alle børn under 5 år i Østrig, Belgien, Holland, Portugal og Schweiz tilsammen.

Miljøforringelser og klimaforandringer påvirker fysiske og sociale miljøer, viden, værdier og adfærd. Omfanget af de dårlige forhold kan spille sammen og dermed øge den negative indvirkning – for eksempel er intensiteten af sundhedsrisici højest, hvor der er utilstrækkelige vand- og sanitetsforhold, afsavn der ofte falder sammen. Af de 10 lande, som har den højeste dødelighed som følge af miljøkatastrofer, ligger 6 lande blandt de øverste 10 i MPI, herunder Niger, Mali og Angola (figur 7).

Hindring af uddannelsesfremskridt for dårligt stillede børn, især piger

Trods tæt ved universel indskrivning i grundskolen i store dele af verden er der stadig forskelle. Næsten 3 ud af 10 børn i skolealderen i lande med et lavt HDI bliver slet ikke indskrevet i grundskolen. Der er ligeledes stadig mange begrænsninger selv for børn, som er indskrevet i skole, hvoraf nogle er miljørelaterede begrænsninger. Manglende elektricitet har for eksempel en både direkte og en indirekte betydning. Adgang til elektricitet kan give bedre lys og dermed længere

undervisningstid, ligesom brugen af moderne ovne reducerer den tid, der skal bruges på at samle brænde og hente vand – aktiviteter, som har vist sig at hæmme børns uddannelsesfremskridt og begrænse deres indskrivning i skolen. Ofte går det særlig hårdt ud over pigerne, fordi de oftere skal kombinere indsamling af ressourcer og skolegang. Adgang til rent vand og forbedret sanitet er også specielt vigtig for pigers uddannelse, idet det giver dem bedre helbred og mere tid og privatliv.

Andre negative konsekvenser

Miljørelaterede afsavn i husholdningen kan falde sammen med mere omfattende miljøpåvirkninger, som begrænser folks valgmuligheder i en lang række sammenhænge og gør det vanskeligere at tjene til livet via ressourcer. Det kan betyde, at folk skal arbejde mere for at opnå det samme afkast eller måske endda flytte for at komme væk fra miljøforringelserne.

Det er tidskrævende at have et livsgrundlag, som er afhængigt af naturressourcer, især hvis husstanden mangler moderne brændsel til madlavning og rent vand. Undersøgelser af tidsforbrug synliggør de tilknyttede kønsbaserede uligheder: Kvinder bruger typisk langt flere timer end mænd på at hente brænde og vand, og piger bruger ofte mere tid end drenge gør. Kvinders omfattende inddragelse i disse aktiviteter har også vist sig at forhindre dem i at engagere sig i aktiviteter med et større afkast.

Som det anførtes i HDR fra 2009, giver mobilitet folk mulighed for at vælge, hvor de vil bo og er dermed vigtig for at øge folks frihed og for at opnå bedre resultater. Men juridiske begrænsninger gør migration risikabel. Det er vanskeligt at vurdere, hvor mange mennesker, der flytter på grund af miljøforringelser, da der også er andre faktorer i spil, især fattigdom. Ikke desto mindre er de skønsmessige vurderinger meget høje.

Miljøforringelser er også blevet forbundet med en øget sandsynlighed for konflikt. Sammenhængen er dog ikke direkte og påvirkes af den bredere politiske og økonomiske kontekst og andre faktorer, som gør individer, befolkningsgrupper og samfund sårbare over for effekten af miljøforringelser.

En stigning på 10 procent i antallet af mennesker, der påvirkes af en ekstrem vejrbegebenhed, reducerer et lands HDI med næsten 2 procent, og det har en endnu større effekt på indkomst og på lande med et middel HDI

Ved at opfylde udækkede behov for familieplanlægning senest i 2050 ville man kunne sænke verdens CO2-udledning til omkring 17 procent under det, den er i dag

Ulighedsskabende effekter af ekstreme vejrbegebenheder

Parallelt med yderst skadelige kroniske trusler kan miljøforringelser øge sandsynligheden for akutte trusler med ulighedsskabende virkning. Vores analyse viser, at en stigning på 10 procent i antallet af mennesker, der påvirkes af en ekstrem vejrbegebenhed, reducerer et lands HDI med næsten 2 procent, og det har en endnu større effekt på indkomst og på lande med et middel HDI.

Og byrden fordeles ikke jævnt: Risikoen for tilskadekomst og død ved oversvømmelser, kraftig vind og jordskred er højere blandt børn, kvinder og gamle, især for de fattige. Den slående ulighed mellem kønnene ved naturkatastrofer antyder, at ulighed i eksponering, såvel som adgang til ressourcer, evner og muligheder, systematisk stiller kvinder dårligere ved at gøre dem mere sårbare.

Børn lider uforholdsmæssigt meget efter vejrkatastrofer, fordi de varige effekter af fejlernæring og manglende undervisning begrænser deres fremtidige muligheder. Undersøgelseresultater fra mange udviklingslande viser, hvordan midlertidigt indtægtsvigt kan få husstande til at trække børn ud af skolen. Mere generelt er der flere faktorer, der spiller ind på, hvor udsat en husstand er for negative påvirkninger og deres evne til at tilpasse sig. Det gælder blandt andet påvirkningens art, den socioøkonomiske situation, sociale kapital og uformelle støtte, samt hvor retfærdig og effektiv genopbygningsindsatsen er.

Empowerment – reproduktive valg og politiske ubalancer

Ændringer i kønsroller og styrkelse af menneskers indflydelse på eget liv (*empowerment*) har gjort nogle lande og grupper i stand til at forbedre miljømæssig bæredygtighed og social retfærdighed og derved fremme menneskelig udvikling.

Ligestilling

Vores ligestillingsindeks (Gender Inequality Index – GII), der i år er blevet gjort op for 145 lande, viser, hvordan begrænsninger i den reproduktive sundhed bidrager til ulighed mellem kønnene. Dette er vigtigt, fordi

kvinder i de lande, hvor der er fri adgang til effektiv familieplanlægning, får færre børn, og det medfører gevinster for mødre- og børnesundheden og reducerer udledning af drivhusgas. Eksempelvis har Cuba, Mauritius, Thailand og Tunesien, hvor reproduktiv sundhed og svangerskabsforebyggelse er let tilgængelig, en fødselsrate på under to fødsler pr. kvinde. Men på verdensplan er der stadig enorme udækkede behov, og undersøgelsesresultater viser, at hvis alle kvinder frit kunne vælge i forhold til reproduktion, ville befolkningvæksten falde så meget, at det ville nedbringe udledningen af drivhusgas til under det nuværende niveau. Ved at opfylde udækkede behov for familieplanlægning senest i 2050 ville man kunne sænke verdens CO2-udledning til omkring 17 procent under det, den er i dag.

GII fokuserer også på kvinders deltagelse i politiske beslutninger og understreger, at kvinder halter efter mænd i hele verden, især i Afrika Syd for Sahara, Sydasien og de arabiske stater. Dette har stor betydning for bæredygtighed og social retfærdighed. Kvinder står ofte for hovedparten af ressourcindsamlingen og er mest udsat for indendørs luftforurening. Derfor påvirkes de i højere grad end mænd af beslutninger vedrørende naturressourcer. Nye undersøgelser afslører, at det ikke alene har betydning, at kvinder deltager, men også hvordan og hvor meget de deltager. Kvinder viser ofte større interesse for miljøet, støtter miljøvenlige politikker og stemmer på ledere, der sætter miljøet i højsædet, og derfor kan øget deltagelse af kvinder i politik og NGO'er give miljøgevinster med en positiv multiplikatoreffekt på tværs af alle FN's 2015 Mål.

Disse argumenter er ikke nye, men de bekræfter værdien af at øge kvinders reelle frihed. Kvinders politiske deltagelse har således både en selvstændig værdi og en instrumentel betydning for at fremme social retfærdighed og begrænse miljøforringelser.

Magtuligheder

Som anført i HDR 2010 har *empowerment* mange aspekter og indebærer blandt andet formelt, procesorienteret demokrati på nationalt plan og mulighed for politisk deltagelse

på lokalt plan. Befolkningens politiske inddragelse på det nationale og lokale plan har vist sig at forbedre miljømæssig bæredygtighed. Og skønt kontekst er vigtig, viser undersøgelser, at demokratier typisk er mere ansvarlige over for vælgerne og i højere grad støtter borgerrettigheder. Imidlertid er det en udfordring alle steder, selv i demokratiske systemer, at de mennesker, der rammes hårdst af de negative effekter af miljøforringelser, ofte også er de dårligst stillede og dem, der har mindst politisk indflydelse. Denne situation medfører, at de politiske prioriteringer sjældent afspejler deres interesser og behov.

Flere undersøgelser viser, at magtfuldheder i politiske institutioner påvirker miljømæssige beslutninger og resultater i en række lande og kontekster. Det betyder, at fattige mennesker og andre dårligt stillede grupper lider uforholdsmæssigt under virkningerne af miljøforringelser. Nye analyser af ca. 100 lande udarbejdet til denne rapport bekræfter, at der er en positiv sammenhæng mellem større lighed i magtfordeling i bred forstand og bedre miljøresultater, herunder bedre adgang til vand, mindre jordforringelser og færre dødsfald som følge af inden- og udendørs luftforurening samt beskidt vand, hvilket antyder et vigtigt spillerum for positive synergieffekter.

Positive synergieffekter – succesfulde strategier for miljøet, social retfærdighed og menneskelige udvikling

For at håndtere de udfordringer, som er blevet uddybet her, har en række regeringer, aktører i civilsamfundet og den private sektor samt udviklingspartnere skabt tiltag, der integrerer miljømæssig bæredygtighed, social retfærdighed og menneskelig udvikling – i strategier som fremmer alle tre. Effektive løsninger skal være kontekstspecifikke. Men det er ikke desto mindre vigtigt at overveje lokale og nationale erfaringer, der har potentiale og anerkende principper, som fungerer på tværs af kontekst. På det lokale plan understreger vi behovet for inkluderende institutioner; på det nationale plan mulighederne for

opskaleringen af vellykkede innovative løsninger og politisk reform.

Den politiske dagsorden er enorm. Denne rapport kan ikke yde den fuld retfærdighed, men dens værditilførelse består i at identificere strategier, som har succes med at tackle vores sociale, økonomiske og miljømæssige udfordringer ved at håndtere, eller endda omgå, trade offs gennem tiltag, der ikke kun er gode for miljøet, men også for social retfærdighed og menneskelig udvikling i bred forstand. For at inspirere til debat og handling giver vi konkrete eksempler på, hvordan strategien for at overvinde potentielle trade-offs og identificere positive synergieffekter har fungeret i praksis. Som eksempel præsenterer vi moderne energi.

Adgang til moderne energi

Energi er central for menneskelig udvikling, og alligevel mangler rundt regnet 1,5 milliarder mennesker på verdensplan elektricitet – det er mere end en ud af fem. Blandt flerdimensionelt fattige er afsavnene langt større – her mangler en ud af tre adgang til moderne energi.

Er der et trade-off mellem en forøgelse af energiforsyning og CO₂-udledning? Ikke nødvendigvis. Vi hævder, at denne sammenhæng ofte er forkert karakteriseret. Der er mange lovende projekter, som vil øge adgangen uden tunge ofre for miljøet:

- Det er teknisk muligt at skaffe fattige husholdninger energi via decentrale systemer, der ikke er tilsluttet energinettet. Disse løsninger kan finansieres og leveres med minimal påvirkning af miljøet.
- Det skønnes, at en fremskaffelse af basale moderne energiydelser til alle ville øge CO₂-udledningen med blot 0,8 procent – hvis de brede politiske forpligtelser, der allerede er givet løfte om, tages i betragtning.

Den globale energiforsyning nåede et vendepunkt i 2010, hvor vedvarende energi stod for 25 procent af verdens strømkapacitet og leverede mere end 18 procent af verdens elektricitet. Udfordringen består i at udvide adgangen i et omfang og med en hastighed, der vil forbedre livet for fattige kvinder og mænd nu og fremover.

Der er mange lovende projekter, som vil øge adgangen til energi uden tunge ofre for miljøet

Traditionelle metoder til at vurdere miljøpolitikker har ofte ikke meget at bidrage med, når det kommer til fordelingsproblematikker. Derimod er betydningen af social retfærdighed og inddragelse allerede eksplicit i målene for grønne økonomiske politikker, og vi foreslår, at denne dagsorden føres videre

Afværgelse af miljøødelæggelse

Miljøforringelser kan afværges med midler, der spænder fra øget reproduktiv sundhed til styrkelse af den måde hvorpå skove forvaltes og tilpassede katastrofeindsatser.

Reproduktive rettigheder, herunder adgang til reproduktive sundhedsydelse, er en forudsætning for kvinders muligheder for at have indflydelse på eget liv og være med til at afværge miljøforringelser. Store forbedringer er mulige. Der findes masser af eksempler på, at det er muligt at benytte den eksisterende sundhedsinfrastruktur til at levere reproduktive sundhedsydelse for meget små ekstraudgifter og med stor betydning for lokalsamfundet. Se blot på Bangladesh, hvor fødselsraten faldt fra 6,6 fødsler pr. kvinde i 1975 til 2,4 i 2009. Regeringen benyttede oopsøgende arbejde, gav tilskud til at gøre prævention lettere tilgængelig og påvirkede sociale normer gennem diskussioner med meningsdannere af begge køn, herunder religiøse ledere, lærere og NGO'er.

Samfundets forvaltning af skovområder kan råde bod på lokale miljøforringelser og mindske kulstofudledningen, men erfaringen viser, at det også indebærer en risiko for at udelukke og stille allerede marginaliserede grupper endnu dårligere. For at undgå disse risici understreger vi vigtigheden af bred deltagelse i udformning og implementering af forvaltningen af skovområder, især af kvinder, fattige grupper og de, der er afhængige af skovens ressourcer, så de ikke bliver dårligere stillet.

Der er også lovende muligheder for at reducere de negative følger af katastrofer gennem et retfærdigt og tilpasset katastrofeberedskab, der indeholder innovative sociale beskyttelsesprogrammer. Katastrofeberedskab omfatter samfundsbase ret kortlægning af risici og en mere progressiv fordeling af de aktiver i samfundet, som genopbygges. Erfaring viser, at det kan være en fordel at skifte til decentrale modeller for nedsættelse af risici. Sådanne tiltag kan styrke lokalsamfund, specielt kvinder, ved at lægge vægt på deltagelse i planlægning og beslutningstagning. Samfund kan genopbygges på måder, der afhjælper eksisterende uligheder.

Nytænkning af vores udviklingsmodel – løftestænger til forandring

De store uligheder på tværs af mennesker, grupper og lande, som bidrager til de store og stadig større miljøtrusler, stiller verden over for massive politiske udfordringer. Men der er grund til optimisme. I mange henseender er betingelserne for fremskridt bedre i dag end nogensinde før - i betragtning af de innovative politikker og initiativer vi ser i nogle dele af verden. Det kræver nytænkning at bringe debatten videre, især så tæt på FN's konference om bæredygtig udvikling, Rio+20, og starten på den æra som skal følge efter 2015 Målene. Denne rapport fremsætter en ny vision for at fremme menneskelig udvikling ud fra et samlet perspektiv på bæredygtighed og social retfærdighed. På lokalt og nationalt plan understreger vi behovet for at sætte social retfærdighed øverst på dagsordenen i udformning af politikker og udviklingsprogrammer samt at udnytte de potentielle multiplikationseffekter, der ligger i større inddragelse og indflydelse på de juridiske og politiske processer. På den globale plan fremhæver vi behovet for at afsætte flere ressourcer til at tackle presserende miljøtrusler og til at fremme social retfærdighed og inddragelse af dårligt stillede lande og grupper for derved at forbedre adgang til finansiering.

Integration af social retfærdighed i grønne økonomiske politikker

Et vigtigt hovedtema i denne rapport er behovet for at integrere social retfærdighed i politikker, der påvirker miljøet. Traditionelle metoder til at vurdere miljøpolitikker kommer til kort. De kan muligvis belyse, hvilken vej påvirkningerne af eksempelvis fremtidige udledninger vil gå, men de har ofte ikke meget at bidrage med, når det kommer til fordelingsproblematikker. Selv når virkningerne på forskellige grupper tages i betragtning, er opmærksomheden typisk begrænset til folks indkomst. Vigtigheden af social retfærdighed og inddragelse er allerede eksplicit i målene for grønne økonomiske politikker. Vi foreslår, at denne dagsorden føres videre.

En række grundprincipper kunne hjælpe med at inddrage de overordnede sociale retfærdighedsproblematikker i politikudviklingen, hvis man involverede alle parter i en analyse, der tager følgende i betragtning:

- Ikke indkomstafhængige mål for velfærd gennem værktøjer såsom MPI.
- Indirekte og direkte effekter af politikker.
- Mekanismer som udløser erstatning til de mennesker, som påvirkes negativt.
- Risiko for ekstreme vejrforhold, der uanset hvor sandsynlig de er, kan være katastrofale. Det er afgørende at foretage en tidlig analyse af de fordelings- og miljømæssige konsekvenser af politikker.

Et rent og sikkert miljø – en rettighed, ikke et privilegium

Det kan være effektivt at indbygge miljørettigheder i nationale forfatninger, ikke mindst fordi det sætter borgerne i stand til at beskytte sådanne rettigheder. Mindst 120 lande har forfatninger, der behandler miljønormer. Og mange lande uden eksplicite miljørettigheder fortolker generelle forfatningsbestemmelser, således at individuelle rettigheder omfatter en fundamental ret til et sundt miljø.

En forfatningsmæssig anerkendelse af lige rettigheder til et sundt miljø fremmer social retfærdighed, idet adgang til et sundt miljø ikke længere er forbeholdt de personer, som har råd til det. Herudover kan det påvirke regeringens prioritering og ressourcellokering at indbygge denne ret i lovgivningen.

Parallet med den lovmæssige anerkendelse af lige rettigheder til et sundt og velfungerende miljø er der et behov for effektive institutioner, herunder en retfærdig og uafhængig domstol og adgang til relevant information fra regeringer og virksomheder. Det internationale samfund anerkender også i stigende grad retten til miljøinformation.

Deltagelse og ansvarlighed

Valgmuligheder er centralt for menneskelig udvikling og har, som det blev fremført i sidste års HDR, både en iboende og en instrumentel værdi. Store uligheder i fordelingen af magt og indflydelse omsættes til store uligheder i miljømæssige resultater. Modsat kan en mere ligelig

fordeling af magt og indflydelse føre til positive og retfærdige miljømæssige resultater. Demokrati er vigtigt, men derudover skal nationale institutioner være ansvarlige og inddragende – især for berørte grupper, herunder kvinder – så civilsamfundet kan gøre sig gældende, og det bliver muligt at fremme adgang til information.

Åbne, transparente og inddragende deliberative processer er en forudsætning for deltagelse – men i praksis er der stadig en række barrierer for aktiv politisk deltagelse. Trods positive forandringer er der stadig brug for at styrke mulighederne for at spille en mere aktiv rolle blandt de grupper, der traditionelt bliver udelukkede, såsom oprindelige folk. Og stadig flere undersøgelsesresultater peger på betydningen af at støtte kvinders engagement, både fordi det er vigtigt i sig selv, og fordi det har vist sig at være positivt forbundet med at opnå mere bæredygtige resultater. De lande, hvor regeringer er lydhyre over for anliggender, der optager befolkningen, er der større sandsynlighed for forandring. Et gunstigt miljø for civilsamfundet skaber også politisk ansvarlighed på det lokale, nationale og globale plan. Samtidig er pressefrihed af afgørende betydning for at skabe politisk bevidsthed og fremme offentlighedens deltagelse.

Finansiering af investeringerne: hvor står vi?

Debatter om bæredygtighed rejser store spørgsmål om omkostninger og finansiering, herunder hvem der skal finansiere hvad – og hvordan. Principper om social retfærdighed taler for store overførsler af ressourcer til fattige lande både for at opnå en mere retfærdig adgang til vand og energi og for at tilpasse sig klimaændringer og reducere effekterne af disse.

Vores finansieringsanalyse viser fire vigtige budskaber:

- Behovet for investeringer er store, men de behøver ikke overstige de nuværende udgifter til andre sektorer, som f.eks. militæret. Den skønnede årlige investering for at opnå universel adgang til moderne energikilder er mindre end en ottende-del af de årlige subsidier til fossile brændstoffer.
- Den offentlige sektors engagement er vigtig (nogle donoreres generøsitet skiller sig ud), og den private sektor er en stor og vigtig

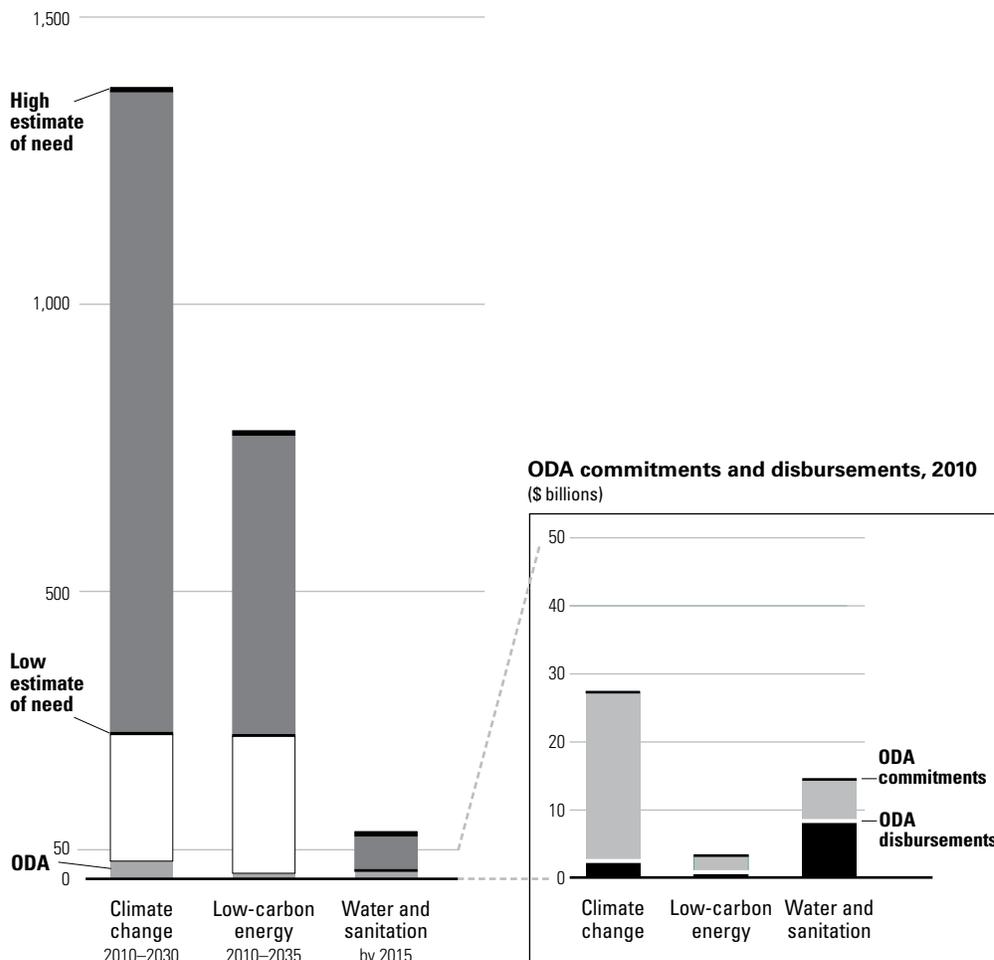

En skat på valuta transaktioner med en meget lav procentsats (0,005 procent) kan indbringe ekstrairtægter på mere end 40 milliarder USD. Ikke ret mange andre tiltag end dette vil kunne imødekomme de nye og yderligere finansieringsbehov, der er blevet fremhævet i internationale debatter

FIGUR 8

Statslig udviklingsbistand dækker langt fra behovet

Estimated future needs and existing official development assistance (ODA)

Annual expenditures (\$ billions)

Source: International Energy Agency, 2010, *World Energy Outlook*, Paris; Organisation for Economic Co-operation and Development; UN Water, 2010, *Global Annual Assessment of Sanitation and Drinking-Water: Targeting Resources for Better Results*, Geneva; World Health Organization; United Nations Department of Economic and Social Affairs, 2010, *Promoting Development, Saving the Planet*, New York; United Nations; and OECD Development Database on Aid Activities: CRS online.

finansieringskilde. Den offentlige sektor kan være katalysator for private investeringer, hvilket understreger betydningen af stigende offentlige bidrag og behovet for at støtte et positivt investeringsklima samt lokal kapacitet.

- Begrænsninger i data gør det vanskeligt at overvåge de private og nationale offentlige sektors udgifter til et bæredygtigt miljø. Der er kun tilgængelige informationer om størrelsen af de statslige udgifter til udviklingsbistand.
- Finansieringsarkitekturen er kompleks og fragmenteret, og det begrænser dens

effektivitet og gør det vanskeligt at overvåge udgifterne. Der er meget at lære fra de løfter om øget effektivitet i udviklingsbistanden, der blev givet i Paris og Accra.

Selvom dokumentationen for behov, løfter og udbetalinger er fragmenteret og omfanget usikkert, er billedet tydeligt: Afstanden mellem den statslige udviklingsbistands størrelse og de investeringer, der er nødvendige for at løse problemerne omkring klimaforandringer, energiproduktion med lav CO₂-udledning samt rent vand og sanitet, er enorme – endnu større end afstanden mellem løfterne

om udviklingsbistand og investeringsbehovet (figur 8). Udgifterne til energikilder med lav CO₂-udledning udgør kun 1,6 procent af det laveste vurderede behov, mens udgifterne til tilpasning og reduktion udgør omkring 11 procent af det laveste vurderede behov. For vand og sanitet er beløbene langt mindre, og officielle tilsagn om udviklingsbistand er tættere på de vurderede omkostninger.

Sådan lukkes hullet i finansieringen: skat på valutatransaktioner – fra god idé til praktisk politik

Den manglende finansiering til at håndtere de udfordringer, som er blevet dokumenteret i denne rapport, kan findes gennem udnyttelse af nye muligheder: Det bedste bud er at lægge en skat på valutatransaktioner. Der blev argumenteret for idéen i HDR 1994, og den accepteres i stigende grad som en praktisk politisk mulighed. Den aktuelle økonomiske krise har vagt fornyet interesse for forslaget, hvilket understreger dets relevans og rettidighed.

Infrastrukturen for valutaafregninger er i dag mere organiseret, centraliseret og standardiseret end tidligere, og det betyder, at det nu ville være lettere at implementere skatten. Forslaget har tilslutning på højt plan, herunder fra den såkaldte ledende gruppe omkring innovativ finansiering (Leading Group on Innovative Financing), som består af 63 lande, heriblandt Kina, Frankrig, Tyskland, Japan og Storbritannien. Og FN's højniveau gruppe af rådgivere om finansiering af klimaforandringer (UN High-Level Advisory Group on Climate Change Financing) foreslog for nylig, at 25-50 procent af indtægterne fra en sådan skat skulle rettes mod tilpasning og reduktion af klimaforandringer i udviklingslande.

Vores seneste analyse viser, at en sådan skat på valutatransaktioner ved en meget lav procentsats (0,005 procent) kan indbringe ekstraintægter på mere end 40 milliarder USD. Ikke ret mange andre tiltag i den nødvendige størrelsesorden vil kunne imødekomme de nye og yderligere finansieringsbehov, der er blevet fremhævet i internationale debatter.

En mere generel skat på finansielle transaktioner har også et stort indkomstsikende potentiale. De fleste G20-lande har allerede

implementeret en skat på finansielle transaktioner, og den Internationale Valutafond (IMF) har bekræftet, at det rent administrativt er muligt at gennemføre en mere generel skat på finansielle transaktioner. Én version af skatten, i form af en afgift på 0,05 procent på nationale og internationale finansielle transaktioner, er skønnet at kunne indbringe 600-700 milliarder USD.

Monetisering af en del af IMF's overskydende særlige trækingsrettigheder (Special Drawing Rights - SDR) har også påkaldt sig interesse. Det vil kunne skaffe op til 75 milliarder USD med få eller ingen budgetmæssige omkostninger for de bidragende regeringer. SDR'erne er ekstra attraktive, idet de også fungerer som et monetært genopretningsinstrument; efterspørgslen forventes at komme fra vækstmarkedsøkonomier, som ønsker at sprede deres reserver.

Reformer for større social retfærdighed og medbestemmelse

At bygge bro over den kløft, der skiller politikere, forhandlere og beslutningstagere fra de borgere, som er mest sårbare over for miljøforringelser kræver, at man gør op med den manglende mulighed for at stille de globalt ansvarlige for miljøet til ansvar. Øget ansvarlighed alene fjerner ikke udfordringen, men er grundlaget for at bygge et socialt og miljømæssigt effektivt globalt ledelsessystem, der leverer resultater til verdens befolkning.

Vi efterlyser tiltag, der vil øge social retfærdighed og medbestemmelse i adgangen til finansiering af miljøforbedringer.

Private ressourcer er afgørende og de fleste finansieringsstrømme til foreksempel energisektoren kommer fra private. Men disse investeringsmønstre er påvirket af investorernes syn på de større risici og mindre overskud, der gør sig gældende i nogle regioner. Uden reformer vil fordelingen af landenes adgang til finansiering forblive uens og dermed skærpe eksisterende uligheder. Dette understreger vigtigheden af at sikre, at strømmene af offentlige investeringer er retfærdige og hjælper til at skabe forhold, der kan tiltrække fremtidige private pengestrømme.

Enhver virkelig forandringsskabende indsats for at standse eller bremse klimaforandringer kræver, at nationale og internationale, private og offentlige tilskuds- og lånemidler blandes

Sagen er klar – der er behov for retfærdighedsprincipper til at styre og fremme internationale finansieringsstrømme. Der er brug for støtte til opbygning af institutioner, således at udviklingslandene kan etablere de rette politikker og incitamenter. De tilhørende styringsmekanismer for international offentlig finansiering skal fordrer medbestemmelse og social ansvarlighed.

Enhver virkelig forandringskabende indsats for at standse eller bremse hastigheden på klimaforandringer kræver, at nationale og internationale, private og offentlige tilskud- og lånemidler blandes. For at fremme både retfærdig adgang til og effektiv udnyttelse af internationale finansieringsstrømme, går denne rapport ind for at sætte nationale interessenter i stand til at sammensætte en klimafinansiering på landeniveau. Nationale klimafonde kan lette den operationelle sammensætning og overvågning af nationale og internationale, private og offentlige tilskud- og lånemidler. Dette er uhyre vigtigt for at sikre national ansvarlighed og positive fordelingsresultater.

Rapporten foreslår, at der fokuseres på fire sæt værktøjer på landeplan til at gennemføre denne plan:

- *Strategier der fremmer lav CO₂-udledning og modstandsdygtighed mod klimaforandringer* – for at ensrette målene for menneskelig udvikling, retfærdighed og klimaforandringer.
- *Offentligt-private partnerskaber* – for at katalysere kapital fra virksomheder og husholdninger.
- *Lokale klimafinansieringsløsninger* – for at skaffe retfærdig adgang til international offentlig finansiering.
- *Koordineret implementering, overvågning-, rapportering- og verificeringssystemer* – for at skaffe langsigtede, effektive resultater og ansvarlighed over for såvel lokale befolkninger som partnere.

Endelig opfordrer vi til at iværksætte et højt profileret globalt initiativ, som skal sikre universel adgang til energi og være fortalere for og yde støtte til udvikling af ren energi på landeniveau. Et sådant initiativ kunne kickstarte arbejdet med at skifte fra gradvis til transformativ forandring.

* * *

Rapporten kaster lys over forbindelsen mellem bæredygtighed og social retfærdighed og viser, hvordan menneskelig udvikling kan blive mere bæredygtig og mere retfærdig. Den afslører, hvordan miljøforringelser skader fattige og sårbare grupper mere end andre. Vi foreslår en politisk dagsorden, der vil afhjælpe disse ubalancer ved at forme en strategi for at tackle aktuelle miljøproblemer på en måde, der fremmer social retfærdighed og menneskelig udvikling. Og vi viser praktiske måder, hvorpå disse supplerende mål kan fremmes i fællesskab ved at give folk flere valgmuligheder og samtidig beskytte vores miljø.

NOTE
The indices use data from different years—see the *Statistical annex* of the full Report (available at <http://hdr.undp.org>) for details and for complete notes and sources on the data. Country classifications are based on HDI quartiles: a country is in the very high group if its HDI is in the top quartile, in the high group if its HDI is in percentiles 51–75, in the medium group if its HDI is in percentiles 26–50 and in the low group if its HDI is in the bottom quartile. Previous Reports used absolute rather than relative thresholds.

NOTES

- Data refer to 2011 or the most recent year available.
- Updated by HDRO based on UNESCO (2011) data.
- Assumes the same adult mean years of schooling as Switzerland before the most recent update.
- Estimated using the purchasing power parity (PPP) and projected growth rate of Switzerland.
- Calculated by the Singapore Ministry of Education.
- Assumes the same adult mean years of schooling as Spain before the most recent update.
- Estimated using the PPP and projected growth rate of Spain.
- Based on cross-country regression.
- Based on data on years of schooling of adults from household surveys from World Bank (2010).
- Based on UNESCAP (2011) and UNDESA (2011) projected growth rates.
- Based on unpublished estimates from the World Bank.
- PPP estimate based on cross-country regression; projected growth rate based on ECLAC (2011) and UNDESA (2011) projected growth rates.
- Based on UNESCO (2011) estimates of education attainment distribution.
- Based on PPP data from IMF (2011).
- Based on EBRD (2011) and UNDESA (2011) projected growth rates.
- Based on World Bank (2011b).
- Based on OECD and others (2011) and UNDESA (2011) projected growth rates.
- Based on data from UNICEF (2000–2010).
- Based on ADB (2011) projected growth rate.
- Based on UNESCWA (2011) and UNDESA (2011) projected growth rates.
- Refers to primary and secondary education only. United Nations Educational, Scientific and Cultural Organization Institute for Statistics estimate.
- Based on ADB (2011) and UNDESA (2011) projected growth rates.
- Based on data from ICF Macro (2011).

DEFINITIONS

Human Development Index (HDI): A composite index measuring average achievement in three basic dimensions of human development—a long and healthy life, knowledge and a decent standard of living. See *Technical note 1* for details on how the HDI is calculated.

Life expectancy at birth: Number of years a newborn infant could expect to live if prevailing patterns of age-specific mortality rates at the time of birth stay the same throughout the infant's life.

Mean years of schooling: Average number of years of education received by people ages 25 and older, converted from education attainment levels using official durations of each level.

Expected years of schooling: Number of years of schooling that a child of school entrance age can expect to receive if prevailing patterns of age-specific enrolment rates persist throughout the child's life.

Gross national income (GNI) per capita: Aggregate income of an economy generated by its production and its ownership of factors of production, less the incomes paid for the use of factors of production owned by the rest of the world, converted to international dollars using purchasing power parity (PPP) rates, divided by midyear population.

GNI per capita rank minus HDI rank: Difference in rankings by GNI per capita and by the HDI. A negative value means that the country is better ranked by GNI than by the HDI.

Nonincome HDI: Value of the HDI computed from the life expectancy and education indicators only.

MAIN DATA SOURCES

Column 1: HDRO calculations based on data from UNDESA (2011), Barro and Lee (2010b), UNESCO Institute for Statistics (2011), World Bank (2011a), UNSD (2011) and IMF (2011).

Column 2: UNDESA (2011).

Column 3: HDRO updates of Barro and Lee (2010b) estimates based on UNESCO Institute for Statistics data on education attainment (2011) and Barro and Lee (2010a) methodology.

Column 4: UNESCO Institute for Statistics (2011).

Column 5: HDRO calculations based on data from World Bank (2011a), IMF (2011) and UNSD (2011).

Column 6: Calculated based on data in columns 1 and 5.

Column 7: Calculated based on data in columns 2, 3 and 4.

NOTES

a. A positive value indicates improvement in rank.

b. Based on less than half the countries in the group or region.

DEFINITION

Human Development Index (HDI): A composite index measuring average achievement in three basic dimensions of human development—a long and healthy life, knowledge and a decent standard of living. See *Technical note 1* for details on how the HDI is calculated.

MAIN DATA SOURCES

Columns 1–7: HDRO calculations based on data from UNDESA (2011), Barro and Lee (2010b), UNESCO Institute for Statistics (2011), World Bank (2011a), UNSD (2011) and IMF (2011).

Columns 8–12: Calculated based on Human Development Index values in the relevant year.

Inequality-adjusted Human Development Index

NOTES

- Change in rank is based on countries for which the Inequality-adjusted Human Development Index is calculated.
- Data refer to the most recent year available during the period specified.
- Based on less than half the countries in the group or region.

DEFINITIONS

Human Development Index (HDI): A composite index measuring average achievement in three basic dimensions of human development—a long and healthy life, knowledge and a decent standard of living. See *Technical note 1* for details on how the HDI is calculated.

Inequality-adjusted HDI (IHDI): HDI value adjusted for inequalities in the three basic dimensions of human development. See *Technical note 2* for details on how the IHDI is calculated.

Overall loss: The loss in potential human development due to inequality, calculated as the percentage difference between the HDI and the IHDI.

Inequality-adjusted life expectancy index: The HDI life expectancy index adjusted for inequality in distribution of expected length of life based on data from life tables listed in *Main data sources*.

Inequality-adjusted education index: The HDI education index adjusted for inequality in distribution of years of schooling based on data from household surveys listed in *Main data sources*.

Inequality-adjusted income index: The HDI income index adjusted for inequality in income distribution based on data from household surveys listed in *Main data sources*.

Quintile income ratio: Ratio of the average income of the richest 20 percent of the population to the average income of the poorest 20 percent of the population.

Income Gini coefficient: Measure of the deviation of the distribution of income (or consumption) among individuals or households within a country from a perfectly equal distribution. A value of 0 represents absolute equality, a value of 100 absolute inequality.

MAIN DATA SOURCES

Column 1: HDRO calculations based on data from UNDESA (2011), Barro and Lee (2010b), UNESCO Institute for Statistics (2011), World Bank (2011a) and IMF (2011).

Column 2: Calculated as the geometric mean of the values in columns 5, 7 and 9 using the methodology in *Technical note 2*.

Column 3: Calculated based on data in columns 1 and 2.

Column 4: Calculated based on HDI rank and data in column 2.

Columns 5, 7 and 9: HDRO calculations based on data from United Nations Department of Economic and Social Affairs life tables, the Luxembourg Income Study, Eurostat's European Union Survey of Income and Living Conditions, the World Bank's International Income Distribution Database, the United Nations Children's Fund's Multiple Indicator Cluster Surveys, ICF Macro Demographic and Health Surveys, the World Health Organization's World Health Survey and the United Nations University's World Institute for Development Economics Research's World Income Inequality Database using the methodology in *Technical note 2*. The list of surveys and years of surveys used for each index are available at <http://hdr.undp.org>.

Column 6: Calculated based on data in column 5 and the unadjusted life expectancy index.

Column 8: Calculated based on data in column 7 and the unadjusted education index.

Column 10: Calculated based on data in column 9 and the unadjusted income index.

Columns 11 and 12: World Bank (2011a).

NOTES

- Annual average for 2010–2015.
- Data refer to the most recent year available during the period specified.
- The denominator of the calculation refers to voting members of the House of Representatives only.
- UNESCO Institute for Statistics (2011).
- Refers to an earlier year than that specified.
- For purposes of calculating the Gender Inequality Index, a value of 0.1 percent was used.
- Includes deliveries by cadres of health workers other than doctors, nurses and midwives.
- Data are for 2010.
- No women were elected in 2010; however, one woman was appointed to the cabinet.
- The People's Assembly and the Shoura Assembly were dissolved by the Egypt Supreme Council of Armed Forces on 13 February 2011.
- The parliament was dissolved following the December 2008 coup.

DEFINITIONS

Gender Inequality Index: A composite measure reflecting inequality in achievements between women and men in three dimensions: reproductive health, empowerment and the labour market. See *Technical note 3* for details on how the Gender Inequality Index is calculated.

Maternal mortality ratio: Ratio of the number of maternal deaths to the number of live births in a given year, expressed per 100,000 live births.

Adolescent fertility rate: Number of births to women ages 15–19 per 1,000 women ages 15–19.

Seats in national parliament: Proportion of seats held by women in a lower or single house or an upper house or senate, expressed as percentage of total seats.

Population with at least secondary education: Percentage of the population ages 25 and older that have reached secondary education.

Labour force participation rate: Proportion of a country's working-age population that engages in the labour market, either by working or actively looking for work, expressed as a percentage of the working-age population.

Contraceptive prevalence rate, any method: Percentage of women of reproductive age (ages 15–49) who are using, or whose partners are using, any modern or traditional form of contraception.

At least one antenatal visit: Percentage of women who used antenatal care provided by skilled health personnel for reasons related to pregnancy at least once during pregnancy, as a percentage of live births.

Births attended by skilled health personnel: Percentage of deliveries attended by personnel (including doctors, nurses and midwives) trained to give the necessary care, supervision and advice to women during pregnancy, labour and postpartum; to conduct deliveries on their own; and to care for newborns.

Total fertility rate: Number of children that would be born to each woman if she were to live to the end of her child-bearing years and bear children at each age in accordance with prevailing age-specific fertility rates.

MAIN DATA SOURCES

Columns 1 and 2: HDRO calculations based on UNICEF (2011), UNDESA (2011), IPU (2011), Barro and Lee (2010b), UNESCO (2011) and ILO (2011).

Column 3: WHO, UNICEF, UNFPA and World Bank (2010).

Columns 4 and 13: UNDESA (2011).

Column 5: IPU (2011).

Columns 6 and 7: HDRO updates of Barro and Lee (2010b) estimates based on UNESCO Institute for Statistics data on education attainment (2011) and Barro and Lee (2010a) methodology.

Columns 8 and 9: ILO (2011).

Columns 10–12: UNICEF (2011).

NOTES

- Not all indicators were available for all countries; caution should thus be used in cross-country comparisons. Where data are missing, indicator weights are adjusted to total 100 percent. For details on countries missing data, see Alkire and others (2011).
- D* indicates data are from Demographic and Health Surveys, *M* indicates data are from Multiple Indicator Cluster Surveys, *W* indicates data are from World Health Surveys and *N* indicates data are from national surveys.
- Data refer to the most recent year available during the period specified.
- Upper bound estimate.
- Lower bound estimate.
- Refers to only part of the country.

DEFINITIONS

Multidimensional Poverty Index: Percentage of the population that is multidimensionally poor adjusted by the intensity of the deprivations. See *Technical note 4* for details on how the Multidimensional Poverty Index is calculated.

Multidimensional poverty headcount: Percentage of the population with a weighted deprivation score of at least 33 percent.

Intensity of deprivation of multidimensional poverty: Average percentage of deprivation experienced by people in multidimensional poverty.

Population vulnerable to poverty: Percentage of the population at risk of suffering multiple deprivations—that is, those with a deprivation score of 20–33 percent.

Population in severe poverty: Percentage of the population in severe multidimensional poverty—that is, those with a deprivation score of 50 percent or more.

Share of multidimensional poor with deprivations in clean water: Percentage of the multidimensionally poor population without access to clean water that is less than a 30 minute walk from home. Clean water is defined using the Millennium Development Goal definition and includes piped water into dwelling, plot

or yard; public tap/standpipe; borehole/tube well; protected dug well; protected spring; rainwater collection; and bottled water (if a secondary available source is also improved). It does not include unprotected well, unprotected spring, water provided by carts with small tanks/drums, tanker truck-provided water and bottled water (if secondary source is not an improved source); or surface water taken directly from rivers, ponds, streams, lakes, dams or irrigation channels.

Share of multidimensional poor with deprivations in improved sanitation: Percentage of the multidimensionally poor population without access to an improved sanitation facility. Improved sanitation facilities are defined using the Millennium Development Goal definition and include flush or pour-flush to piped sewer system or septic tank, ventilated improved pit latrine, pit latrine with slab and composting toilet. Facilities are not considered improved when they are shared with other households or open to the public.

Share of multidimensional poor with deprivations in modern fuels: Percentage of the multidimensionally poor population without access to modern fuels. Households are considered deprived of modern fuels if they cook with wood, charcoal or dung.

Population below PPP \$1.25 a day: Percentage of the population living below the international poverty line \$1.25 (in purchasing power parity terms) a day.

Population below national poverty line: Percentage of the population living below the national poverty line, which is the poverty line deemed appropriate for a country by its authorities. National estimates are based on population-weighted subgroup estimates from household surveys.

MAIN DATA SOURCES

Columns 1 and 2: Calculated from various household surveys, including ICF Macro Demographic and Health Surveys, United Nations Children's Fund Multiple Indicator Cluster Surveys and World Health Organization World Health Surveys conducted between 2000 and 2010.

Columns 3–10: Calculated based on data on household deprivations in education, health and living standards from various household surveys as listed in column 1.

Columns 11 and 12: World Bank (2011a).

NOTES

- The sum of the shares of fossil fuels and renewable energy resources may be greater than 100 percent because some countries generate more electricity than they consume and export the excess.
- Data refer to the most recent year available during the period specified.
- Less than 1 percent.
- For certain amphibian species endemic to Brazil, there was not time for the Global Amphibian Assessment (GAA) Coordinating Team and the experts on the species in Brazil to reach agreement on the Red List Categories. The data for amphibians included in the data displayed here are those that were agreed at the GAA Brazil workshop in April 2003. However, a subsequent GAA check found that many of the assessments were inconsistent with the approach adopted elsewhere in the world, and a "consistent Red List Category" was also assigned to these species. Therefore, data displayed here may not match data in the Global Species Assessment.

DEFINITIONS

Adjusted net savings: Rate of savings in an economy that takes into account investments in human capital, depletion of natural resources and damage caused by pollution (including particulate emissions), expressed as a percentage of gross national income (GNI). A negative value implies an unsustainable path.

Ecological footprint: Amount of biologically productive land and sea area that a country requires to produce the resources it consumes and to absorb the waste it generates.

Environmental performance index: Index comprising 25 performance indicators across 10 policy categories covering both environmental public health and ecosystem vitality.

Primary energy supply, fossil fuels: Percentage of total energy supply that comes from natural resources formed from biomass in the geological past (such as coal, oil and natural gas).

Primary energy supply, renewables: Percentage of total energy supply that comes from constantly replenished natural processes, including solar, wind, biomass, geothermal, hydropower and ocean resources and some waste. Nuclear energy is not included.

Carbon dioxide emissions, per capita: Human-originated carbon dioxide emissions stemming from the burning of fossil fuels, gas flaring and the production of cement, divided by midyear population.

Greenhouse gas emissions per capita: Emissions from methane, nitrous oxide and other greenhouse gases, including hydrofluorocarbons, perfluorocarbons and sulfur hexafluoride, divided by midyear population. Carbon dioxide emissions are not included.

Urban pollution: Particulate matter concentrations in terms of fine suspended particulates of human-made or natural origin less than 10 microns (PM10) in diameter that are capable of penetrating deep into the respiratory tract. Data are urban population-weighted PM10 levels in residential areas of cities with more than 100,000 residents. The estimates represent the average annual exposure level of an urban resident to outdoor particulate matter.

Natural resource depletion: Monetary expression of energy, mineral and forest depletion, expressed as a percentage of total gross national income (GNI).

Fresh water withdrawals: Total fresh water withdrawn in a given year, expressed as a percentage of total renewable water resources.

Forest area: Percentage of total land area spanning more than 0.5 hectares with trees higher than 5 metres and a canopy cover of more than 10 percent, or trees able to reach these thresholds, unless under agricultural or urban land use.

Change in forest area: Percentage change in area under forest cover.

Endangered species: Percentage of animal species (including mammals, birds, reptiles, amphibians, fish and invertebrates) classified as either critically endangered, endangered or vulnerable by the International Union for the Conservation of Nature.

NOTES

- a. Data refer to the most recent year available during the period specified.
b. Less than 1.
c. Less than 0.05.

DEFINITIONS

Population under age 5 suffering from stunting: Percentage of children under age 5 falling two standard deviations or more below the median height-for-age of the reference population.

Population under age 5 suffering from wasting: Percentage of children under age 5 falling two standard deviations or more below the median weight-for-height of the reference population.

Number of deaths due to natural disasters: People confirmed as dead, or missing and presumed dead, as a result of natural disasters, which include drought, extreme temperature, flood, mass movement, wet storm and wildfire.

Population affected by natural disasters: People requiring immediate assistance during a period of emergency as a result of a natural disaster (as defined above), including displaced, evacuated, homeless and injured people.

Deaths due to water pollution: Deaths due to diarrhoea attributable to poor water, sanitation or hygiene.
Deaths due to indoor air pollution: Deaths due to acute respiratory infections (children under age 5), chronic obstructive pulmonary disease (adults over age 30) and lung cancer (adults over age 30) attributable to indoor smoke from solid fuels.

Deaths due to outdoor air pollution: Deaths due to respiratory infections and diseases, lung cancer and selected cardiovascular diseases attributable to outdoor air pollution.

Deaths due to malaria: Deaths due to malaria.

Deaths due to dengue: Deaths due to dengue fever, dengue haemorrhagic fever and dengue shock syndrome.

Population living on degraded land: Percentage of the population living on severely and very severely degraded land. Land degradation estimates consider biomass, soil health, water quantity and biodiversity, and range in severity.

NOTES

The typical World Poll survey includes at least 1,000 surveys of randomly selected individuals. In some countries oversamples are collected in major cities or areas of special interest. Additionally, in some large countries, such as China and the Russian Federation, sample sizes of at least 2,000 are collected. Although rare, in some instances the sample size is between 500 and 1,000. Quality control procedures are used to validate that correct samples are selected and that the correct person is randomly selected in each household. Gallup's methodology ensures that the reported data are representative of 95 percent of the world's adult population (ages 15 and older). For further information, see <https://worldview.gallup.com/content/methodology.aspx>.

a. Very serious and somewhat serious.

b. Data refer to the most recent year available during the period specified.

SURVEY QUESTIONS

Overall life satisfaction: Please imagine a ladder, with steps numbered from zero at the bottom to ten at the top. Suppose we say that the top of the ladder represents the best possible life for you, and the bottom of the ladder represents the worst possible life for you. On which step of the ladder would you say you personally feel you stand at this time, assuming that the higher the step the better you feel about your life, and the lower the step the worse you feel about it? Which step comes closest to the way you feel?

Humans cause global warming: Temperature rise is a part of global warming or climate change. Do you think rising temperatures are a result of human activities? (Asked of those who said they know something or a great deal about global warming and climate change.)

Global warming threat: How serious of a threat is global warming to you and your family? (Asked of those who said they know something or a great deal about global warming and climate change.)

Active in environmental group: Which of these, if any, have you done in the past year? Been active in a group or organization that works to protect the environment.

Satisfaction with government to reduce emissions: Do you think the government of this country is doing enough to reduce emissions of gases released by motor vehicles and factories, or not?

Satisfaction with actions to preserve the environment: In this country, are you satisfied or dissatisfied with the efforts to preserve the environment?

Satisfaction with air quality: In the city or area where you live, are you satisfied or dissatisfied with the quality of air?

Satisfaction with water quality: In the city or area where you live, are you satisfied or dissatisfied with the quality of water?

NOTES

- a. Based on methods described in the statistical annex of WHO (2007). Estimates for 2007 have been revised to take into account the Global Burden of Disease estimates for 2004 and may not be entirely comparable with those for 2002 published in WHO (2004).
- b. Data refer to the most recent year available during the period specified.

DEFINITIONS

Adult literacy rate: Percentage of the population ages 15 and older who can, with understanding, both read and write a short simple statement on their everyday life.

Gross enrolment ratio: Total enrolment in a given level of education (primary, secondary or tertiary), regardless of age, expressed as a percentage of the official school-age population for the same level of education.

Pupil-teacher ratio: Average number of pupils (students) per teacher in primary education in a given school year.

School teachers trained to teach: Percentage of primary school teachers who have received the minimum organized teacher training (pre-service or in-service) required for teaching at the primary level of education.

One-year-olds lacking immunization against DTP: Percentage of one-year-olds who have not received three doses of the combined diphtheria, tetanus toxoid and pertussis (DTP) vaccine.

One-year-olds lacking immunization against measles: Percentage of one-year-olds who have not received at least one dose of a measles vaccine.

Under-five mortality: Probability of dying between birth and exactly age 5, expressed per 1,000 live births.

Adult mortality: Probability that a 15-year-old person will die before reaching age 60, expressed per 1,000 adults.

HIV prevalence: Percentage of the population ages 15–24 who are infected with HIV.

Health-adjusted life expectancy at birth: Average number of years that a person can expect to live in

"full health" taking into account years lived in less than full health due to disease and injury.

MAIN DATA SOURCES

NOTES

- a. Because data are based on national definitions of what constitutes a city or metropolitan area, cross-country comparison should be made with caution.
- b. Data refer to the most recent year available during the period specified.
- c. Includes Svalbard and Jan Mayen Islands.
- d. Includes Christmas Island, Cocos (Keeling) Islands and Norfolk Island.
- e. Includes Åland Islands.
- f. Refers to an earlier year than that specified.
- g. Includes Agalega, Rodrigues and Saint Brandon.
- h. Includes Taiwan Province of China and excludes Hong Kong Special Administrative Region and Macao Special Administrative Region.

DEFINITIONS

Total population: De facto population in a country, area or region as of 1 July.

Average annual population growth: Average annual exponential growth rate for the period indicated.

Urban population: De facto population living in areas classified as urban according to the criteria used by each area or country as of 1 July.

Median age: Age that divides the population distribution into two equal parts—that is, 50 percent of the population is above that age and 50 percent is below it.

Dependency ratio: Ratio of the sum of the population ages 0–14 and that ages 65 and older to the population ages 15–64.

GDP per capita: Gross domestic product (GDP) expressed in purchasing power parity international dollar terms, divided by midyear population.

Foreign direct investment net inflows: Sum of equity capital, reinvestment of earnings, other long-term capital and short-term capital, expressed as a percentage of gross domestic product (GDP).

Net official development assistance received: Disbursements of loans made on concessional terms (net of repayments of principal) and grants by official agencies to promote economic development and welfare in countries and territories in part I of the Development Assistance Committee list of aid recipients, expressed as a percentage of the recipient country's gross national income (GNI).

Remittance inflows: Earnings and material resources transferred by international migrants or refugees to recipients in their country of origin or countries in which the migrant formerly resided, expressed as a percentage of the receiving country's GDP.

Public expenditure on education: Total public expenditure (current and capital) on education, expressed as a percentage of gross domestic product (GDP).

Total expenditure on health: The sum of public and private health expenditure. It includes the provision of health services (preventive and curative), family planning activities, nutrition activities and emergency aid designated for health but does not include provision of water and sanitation.

Column 5: UNDESA (2010).

Columns 8–13: World Bank (2011a).

Begrebsforklaring og forkortelser

Grupper med meget højt HDI, højt HDI, middelhøjt HDI og lavt HDI

Klassificering af et land ud fra dets placering i indekset for menneskelig udvikling (HDI). Et land tilhører kategorien "Meget højtudviklet land" hvis dets HDI er i den øvre kvartil, kategorien "Højtudviklet land" hvis værdien ligger mellem 51–75 percentilen, kategorien "Mellemudviklet land" hvis dets HDI-værdi er i 26–50 percentilen og kategorien "Lavt udviklet land" hvis dets HDI er i den laveste kvartil. I tidligere rapporter har man anvendt absolutte og ikke relative tærskelværdier.

Indekset for menneskelig udvikling (HDI – *Human Development Index*)

En sammensat metode til at måle resultaterne i de tre grundpiller, der er en forudsætning for menneskelig udvikling: Et langt og sundt liv, adgang til uddannelse og en god levestandard. For at gøre det lettere at sammenligne sættes gennemsnitsværdien af resultaterne inden for disse tre grundpiller på en skala fra 0 til 1, hvor 0 er dårligst og 1 er bedst. Værdierne aggregeres ved hjælp af geometrisk gennemsnit.

HDI justeret for ulighed (IHDI – *Inequality-adjusted HDI*)

IHDI måler det gennemsnitlige niveau af menneskelig udvikling i et samfund, når der er taget højde for eventuelle uligheder. Hvis der er fuldstændig lighed er HDI-værdien og IHDI-værdien ens. Jo større forskel der er på tallene des mere ulighed.

Indeks for ulighed mellem kønnene (GII – *Gender Inequality Index*)

En målemetode som opfanger ulighed mellem kønnene indenfor områderne reproduktiv sundhed, medbestemmelse og arbejdstyrke. Værdierne ligger mellem 0 (fuldstændig lighed) og 1 (absolut ulighed).

Flerdimensionelt fattigdomsindeks (MPI – *Multidimensional Poverty Index*)

En metode hvormed man kan måle alvorlige brister inden for områderne sundhed, uddannelse og levestandard, og som kombinerer antallet af fattige med graden af deres fattigdom.

Note: Der findes yderligere information om indeksene i den fulde rapport fra 2010, kapitel 5, og i de tekniske noter i dette års fulde rapport. Rapporten kan downloades her: www.hdr.undp.org

Oversættelse af nøglebegreber

I oversættelsen af det engelske sammendrag af Human Development Report 2011 har vi generelt anvendt følgende forståelse af centrale ord og begreber:

Accountability	Ansvarlighed
Adaptation	Tilpasning
Capabilities	Evner
Climate Deal Flows	Lokale klimafinansieringsløsninger
Climate resilience	Modstandsdygtighed overfor klimaforandringer
Currency transaction tax	Skat på valutatransaktioner
Degradation	Foringelser
Deforestation	Skovrydning
Deprivation	Afsavn
Disadvantaged	Dårligt stillede
Environmental sustainability	Miljømæssig bæredygtighed
Empowerment	Indflydelse på eget liv / <i>empowerment</i>
Equity	Social retfærdighed
Human development	Menneskelig udvikling
Intrinsic	Iboende
Livelihood	Livsgrundlag
Mitigation	Reduktion af CO2
Special drawing rights	Specielle trækingsrettigheder
Transformative change	At skabe varig forandring

Globale, regionale og nationale *Human Development Reports*

Globale Human Development Reports: UNDP's årlige *Human Development Report* (HDR) er blevet udgivet siden 1990 som en videnskabelig uafhængig og empirisk baseret analyse af udviklingstemaer, -tendenser, -fremskridt og -politikker. Materialer fra tidligere års rapporter er tilgængelige på www.hdr.undp.org, herunder de fulde tekster og sammendrag oversat til de store FN-sprog, sammendrag af konsultationer og netværksdiskussioner, tidsskriftet *Human Development Report Series* samt HDR-nyhedsmeldinger og andet oplysningsmateriale. Statistiske indikatorer og andre dataværktøjer, interaktive kort, landebaserede faktaark og andre informative ressourcer relateret til rapporten er også gratis tilgængelige på UNDP's HDR hjemmeside.

Regionale Human Development Reports: I løbet af de sidste to årtier er mere end 40 redaktionelt uafhængige Human Development Reports med regionalt fokus blevet produceret med støtte fra UNDP's regionale kontorer. Med analyser og politiske anbefalinger, som ofte har været provokerende, har disse rapporter undersøgt centrale problemstillinger, som f.eks. civile frihedsrettigheder og kvinders indflydelse på deres egne liv (*empowerment*) i de arabiske stater, korrupsion i Asien og stillehavsområdet, behandling af Romaer og andre minoriteter i Centraleuropa og den ulige fordeling af rigdom i Latinamerika.

Nationale Human Development Reports: Siden den første *Human Development Report* udkom i 1992 er nationale rapporter blevet produceret i 140 lande af lokale redaktioner med støtte fra UNDP. Disse rapporter, som der til dato er udgivet mere end 650 af, lægger et menneskeligt udviklings perspektiv på nationale politiske problemer gennem lokalt ledede konsultationer og forskning. Nationale *Human Development Reports* fokuserer typisk på køn, etnicitet eller forskelle mellem land- og byområder i forsøget på at identificere ulighed, måle fremskridt og identificere varsler om potentiel konflikt. Fordi rapporterne tager udgangspunkt i nationale behov og perspektiver har mange af dem haft stor indflydelse på nationale politikker, herunder strategier for opnåelse af 2015 Målene og andre prioriteter for menneskelig udvikling.

Mere information om nationale og regionale *Human Development Reports* er tilgængelig på www.hdr.undp.org/en/nhdr, hvor man også kan finde relateret undervisningsmateriale og andre ressourcer.

Human Development Reports 1990-2010

- 2010 The Real Wealth of Nations: Pathways to Human Development
- 2009 Overcoming Barriers: Human Mobility and Development
- 2007/8 Fighting Climate Change: Human Solidarity in a Divided World
- 2006 Beyond Scarcity: Power, Poverty and the Global Water Crisis
- 2005 International Cooperation at a Crossroad: Aid, Trade and Security in an Unequal World
- 2004 Cultural Liberty in Today's Diverse World
- 2003 Millennium Development Goals: A Compact among Nations to End Human Poverty
- 2002 Deepening Democracy in a Fragmented World
- 2001 Making New Technologies Work for Human Development
- 2000 Human Rights and Human Development
- 1999 Globalization with a Human Face
- 1998 Consumption for Human Development
- 1997 Human Development to Eradicate Poverty
- 1996 Economic Growth and Human Development
- 1995 Gender and Human Development

www.hdr.undp.org

Den store udviklingsudfordring i det 21. århundrede bliver at sikre nuværende og fremtidige generationer retten til at leve et sundt, langt og fyldstgørende liv. Human Development Report 2011 er et vægtigt bidrag til den globale dialog på dette felt. Rapporten viser, hvordan bæredygtighed og social retfærdighed er uløseligt forbundet og gensidig selvforstærkende. Miljøforringelser forværrer sociale uligheder ved at ramme de mennesker hårdest, der i forvejen er dårligst stillede, og samtidig er uligheder i menneskelig udvikling med til at forværre miljødelæggelser. Yderligere fremskridt i menneskelig udvikling for verdens fattige og underprivilegerede kræver derfor robuste globale tiltag, der kan reducere miljømæssige risici og uligheder på samme tid. Rapporten giver konkrete forslag til hvordan.

Rapporten argumenterer for, at bæredygtighed bør gribes an som et spørgsmål om at sikre grundlæggende social retfærdighed for både nulevende og fremtidige generationer ved at adressere sundhed, uddannelse, indkomst og ulighed mellem kønnene sammen med global handling inden for energiproduktion og beskyttelse af økosystemer.

Endelig giver rapporten konkrete forslag til, hvordan finansieringsbehovet kan dækkes og påviser, at større ansvarlighed, bred politisk inddragelse og demokratiske processer på lokalt, nationalt og internationalt plan er afgørende for at sikre resultater inden for bæredygtig udvikling og social retfærdighed.

Vi har et fælles ansvar over for de mindst privilegerede i verden – både i dag og i fremtiden - og vi skal sikre, at nutiden ikke bliver fremtidens fjende. Rapporten hjælper os til at finde vej.
